

Clojure
core.async

@stuarthalloway
stu@cognitect.com

the problems

objects make terrible machines

function chains make poor machines

direct-connect relationships

callback hell

j.u.c queues block real threads

threads are expensive and/or nonexistent

the opportunity

first class conveyance (queue-like)

processes

multi reader/writer

platform integration (JVM, browser)

robust subsystems

Communicating Sequential Processes (CSP)

first class processes

first class channels

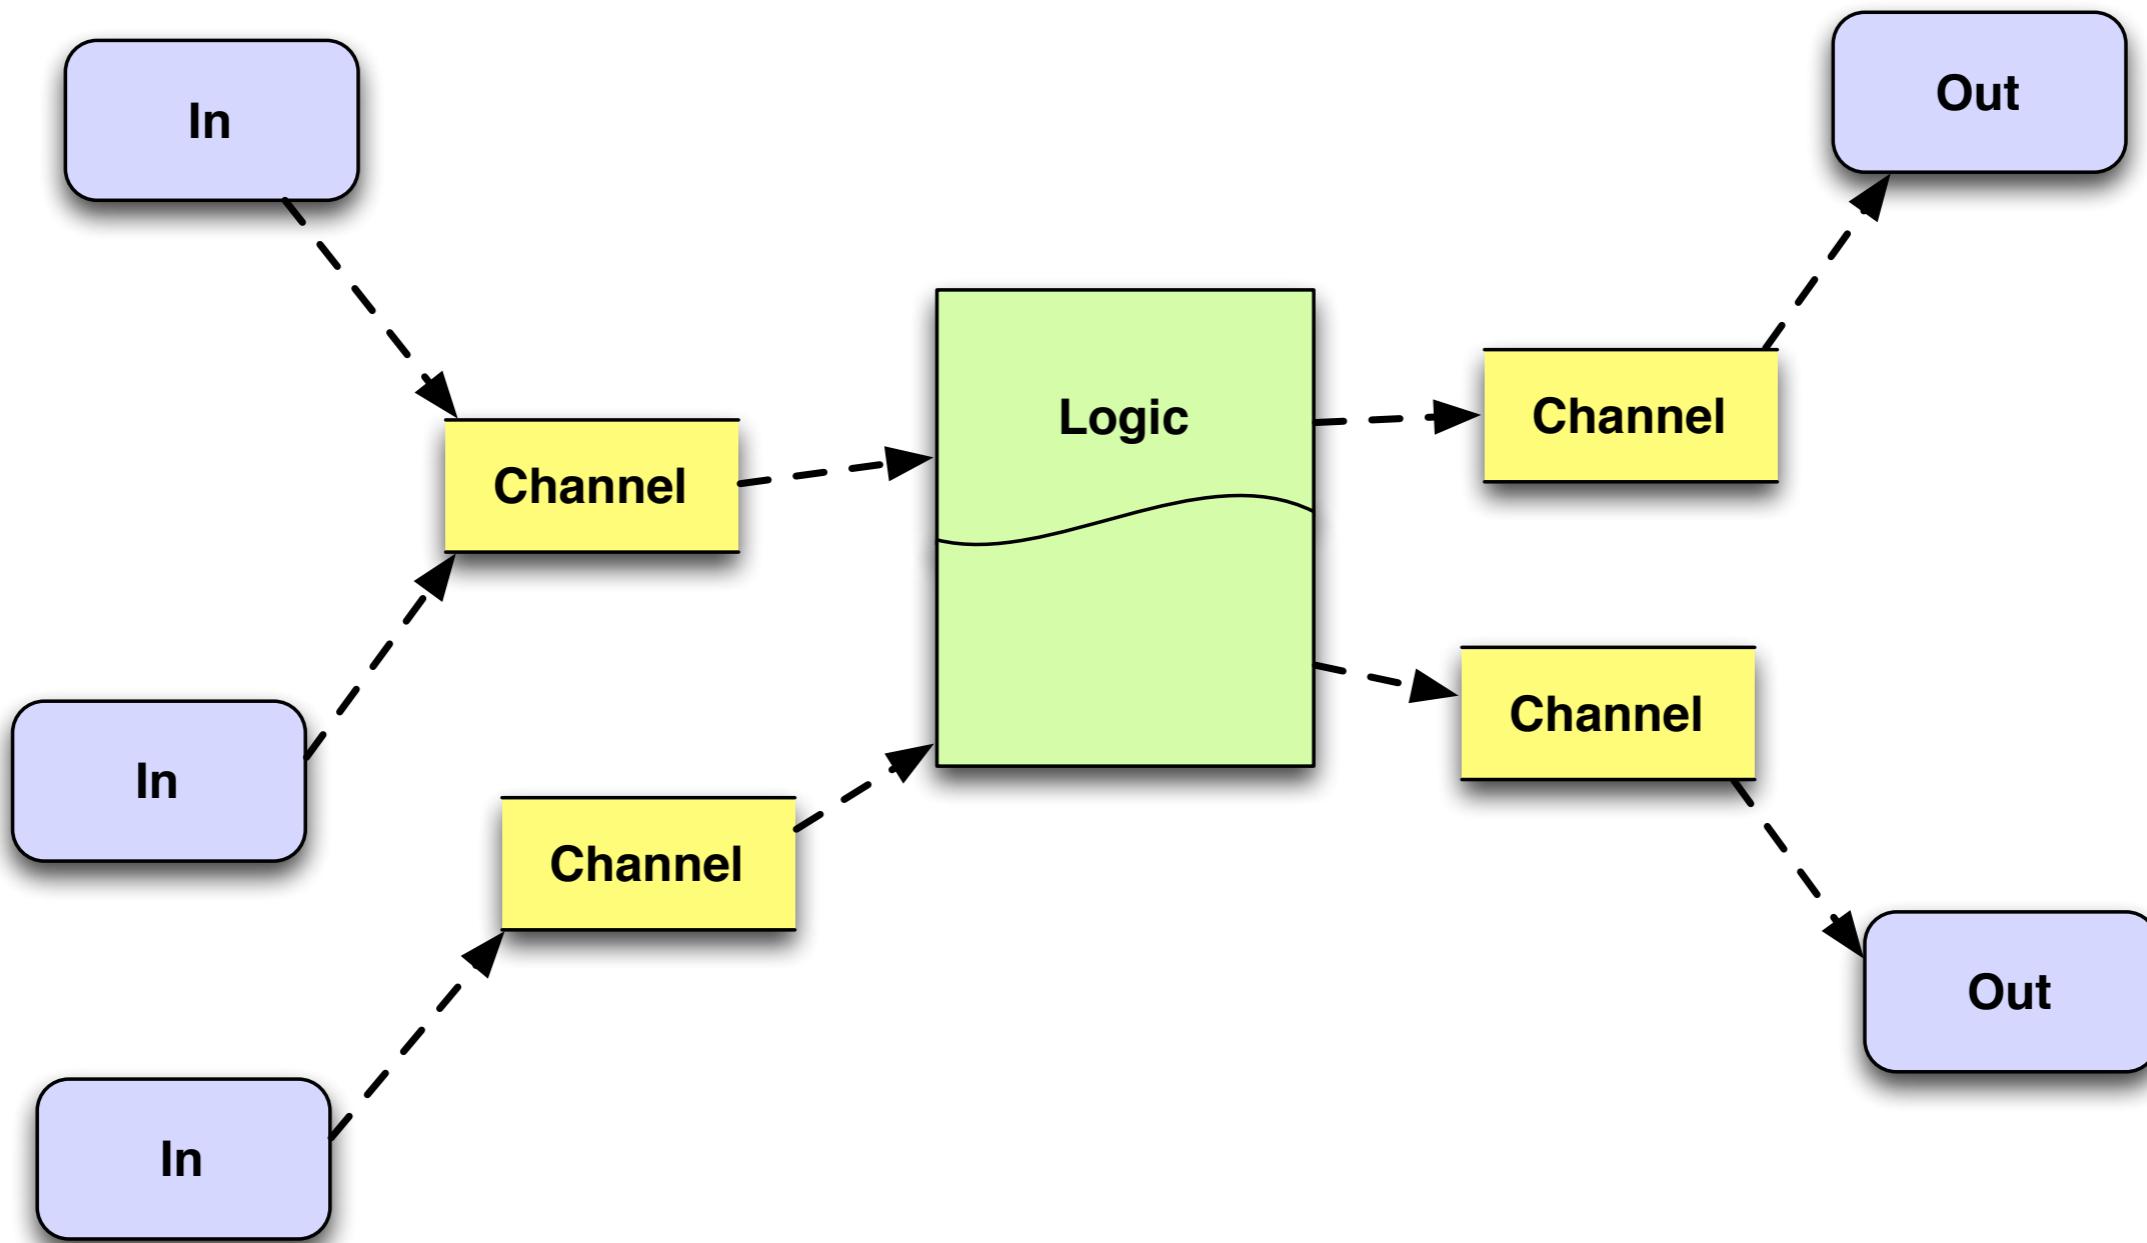

concurrency primitive (coordination)

coherent sequential logic

multi reader/writer

buffering

core.async

first-class processes

```
(go  
  IOC 'thread',  
  state machine,  
  parking  
)  
  
(thread  
  real thread,  
  blocking  
)
```

first-class channels

op	go	thread	(external)
put	($>!$ ch val)	($>!!$ ch val)	(put! ch val)
take	($<!$ ch)	($<!!$ ch)	(take! ch)

single-operation examples

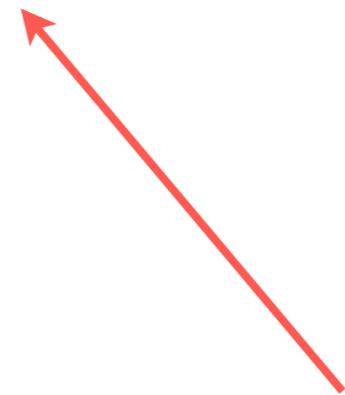

http://go.cognitect.com/core_async_webinar_recording

<https://github.com/cognitect/async-webinar> examples 1-5

"Hello World"

"Hello World"

that is the program

Everything is Data

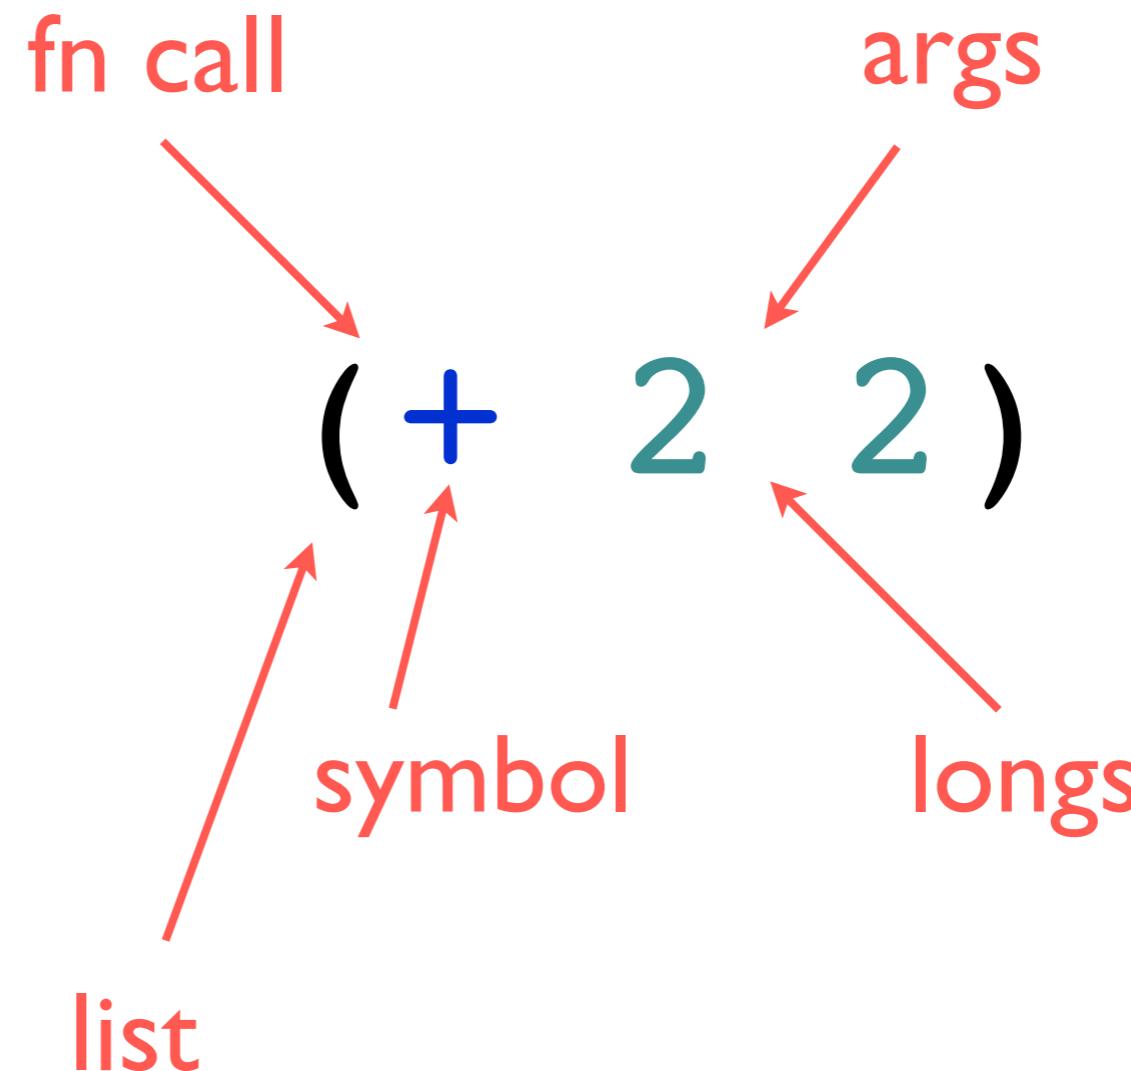

```
{ :firstName "John"  
  :lastName "Smith"  
  :age 25  
  :address {  
    :streetAddress "21 2nd Street"  
    :city "New York"  
    :state "NY"  
    :postalCode "10021" }  
  :phoneNumber  
    [ { :type "name" :number "212 555-1234"}  
     { :type "fax" :number "646 555-4567" } ] }
```

type	examples
string	" foo "
character	\f
integer	42, 42N
floating point	3.14, 3.14M
boolean	true
nil	nil
symbol	foo, +
keyword	:foo, ::foo

type	properties	examples
list	sequential	(1 2 3)
vector	sequential and random access	[1 2 3]
map	associative	{ :a 100 :b 90 }
set	membership	# { :a :b }

Function Call

semantics:

structure:

Function Definition

```
(defn greet
  "Returns a friendly greeting"
  [your-name]
  (str "Hello, " your-name))
```

define a fn fn name docstring
arguments fn body

...Still Just Data

```
(defn greet
  "Returns a friendly greeting"
  [your-name]
  (str "Hello, " your-name))
```

symbol symbol string
vector list

```
graph TD; A[vector] --> B["(defn greet"]; A --> C["[your-name]"]; A --> D["(str \"Hello, \" your-name)"); B --> E[symbol]; C --> E; D --> F[symbol]; G["string"] --> H["\"Returns a friendly greeting\""]; I[list] --> J["your-name"]
```

n separate processes

```
(go (while true (<! (timeout 250)) (>! c 1)))
(go (while true (<! (timeout 1000)) (>! c 2)))
(go (while true (<! (timeout 1500)) (>! c 3)))
```

channel put

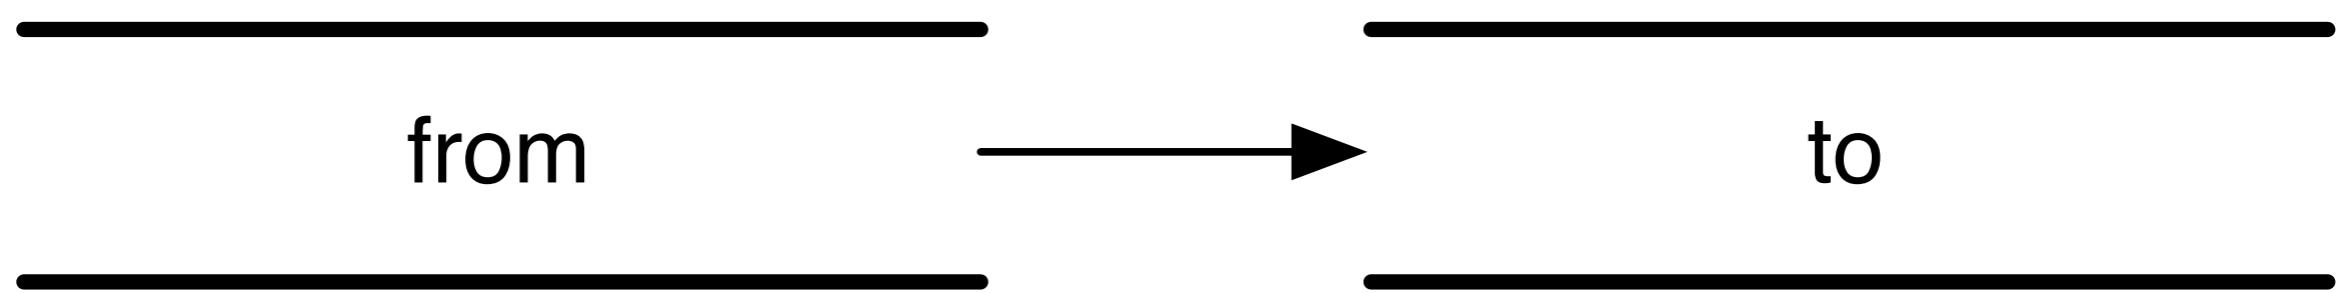

IOC 'thread'

```
(let [out (by-id "ex0-out")]
  (go (loop [results []]
        (set-html out (render results))
        (recur (-> (conj results (<! c)) (peekn 10))))))
```

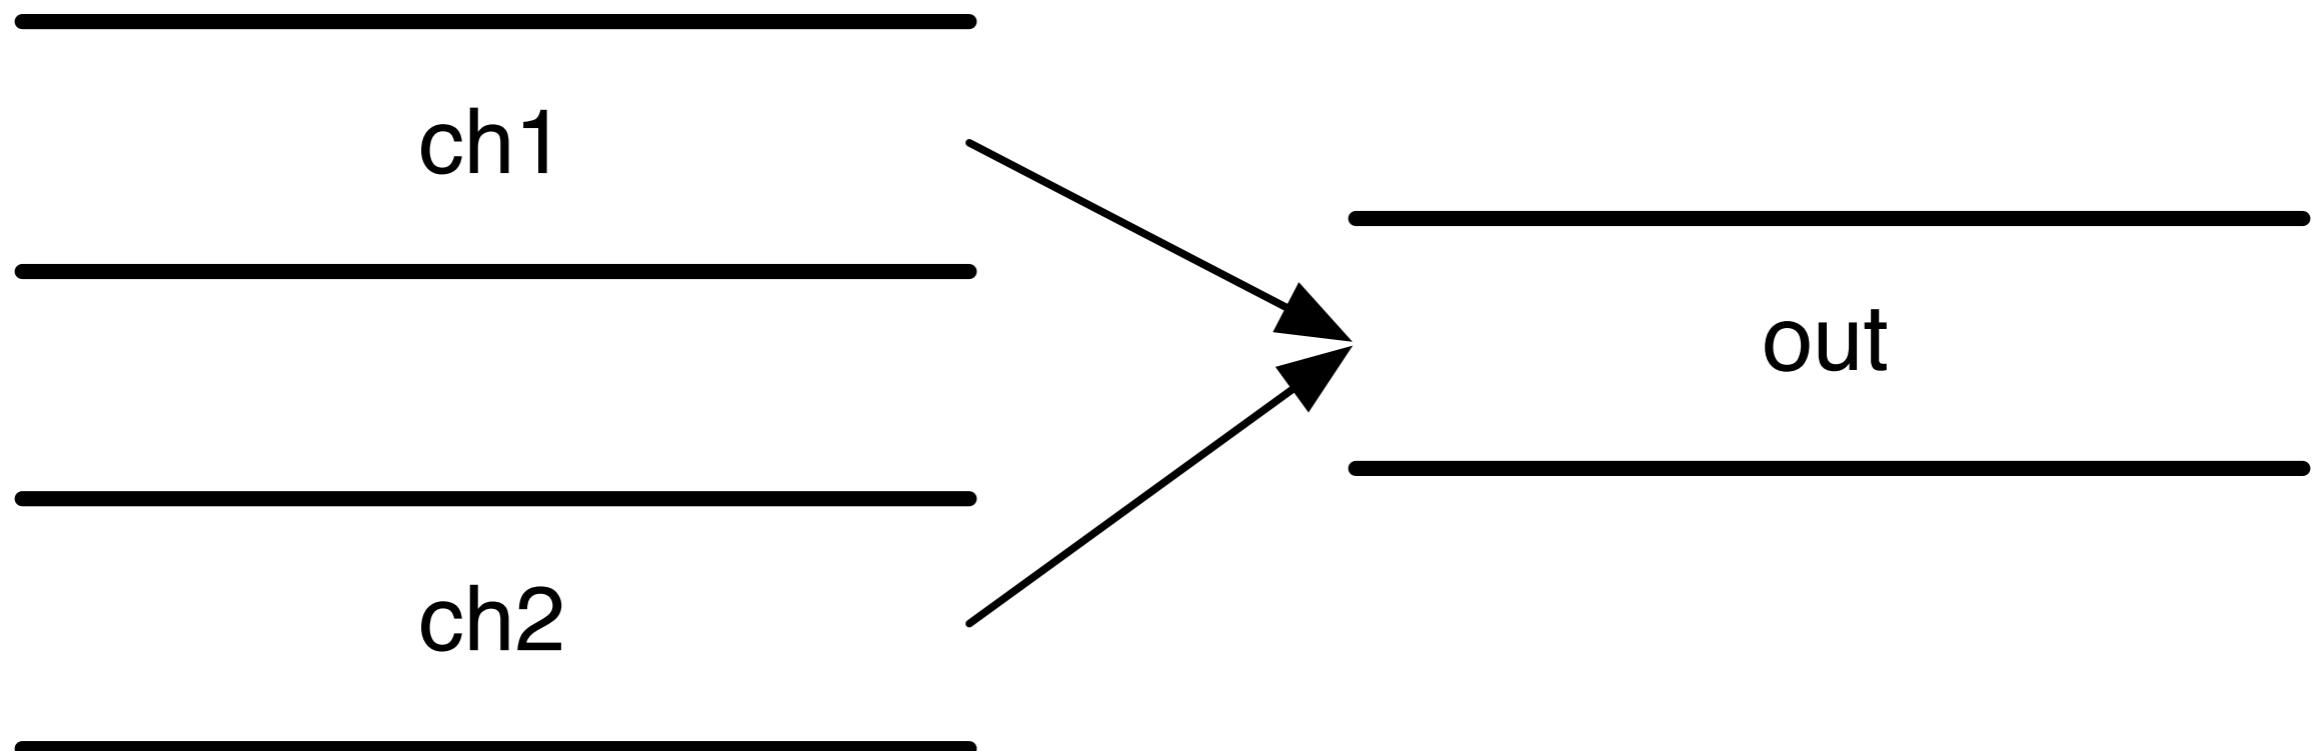

channel get

joint fittings

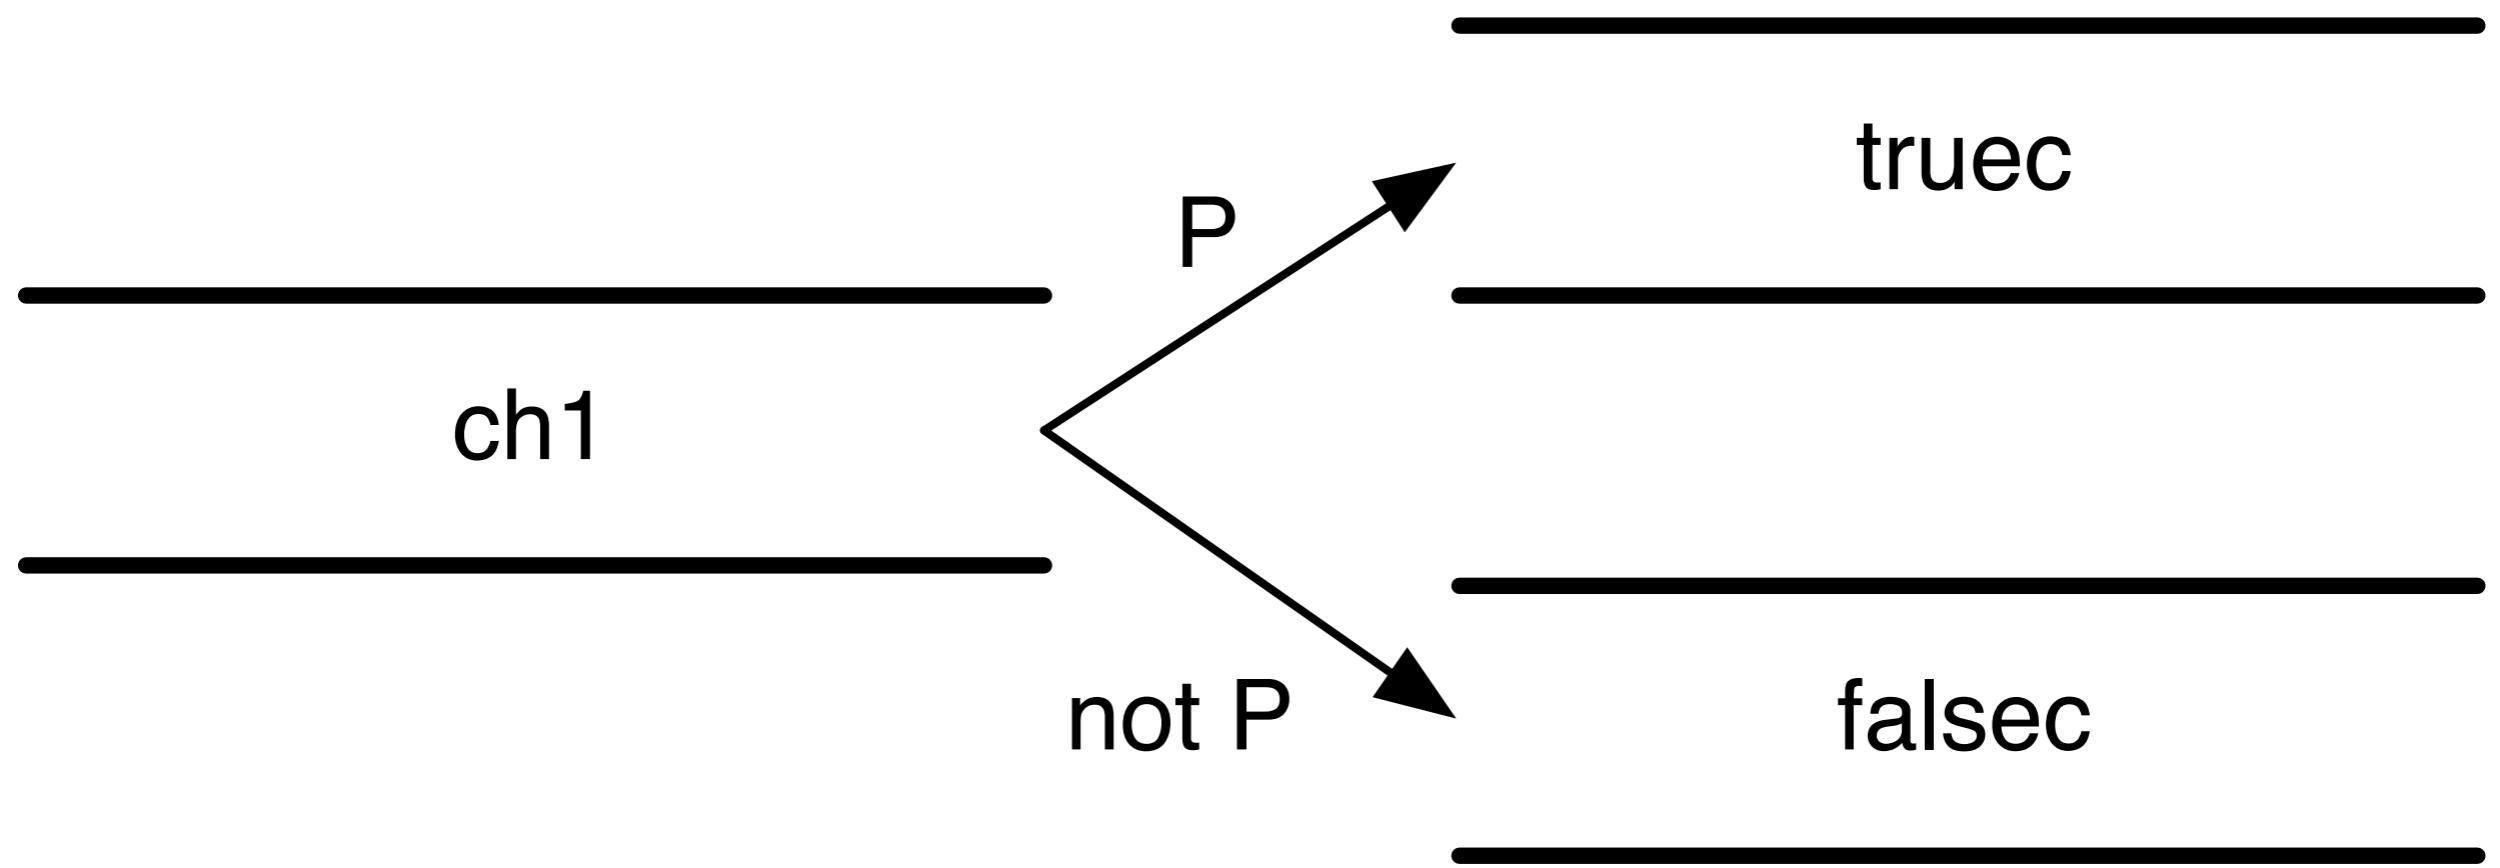

(pipe from to)

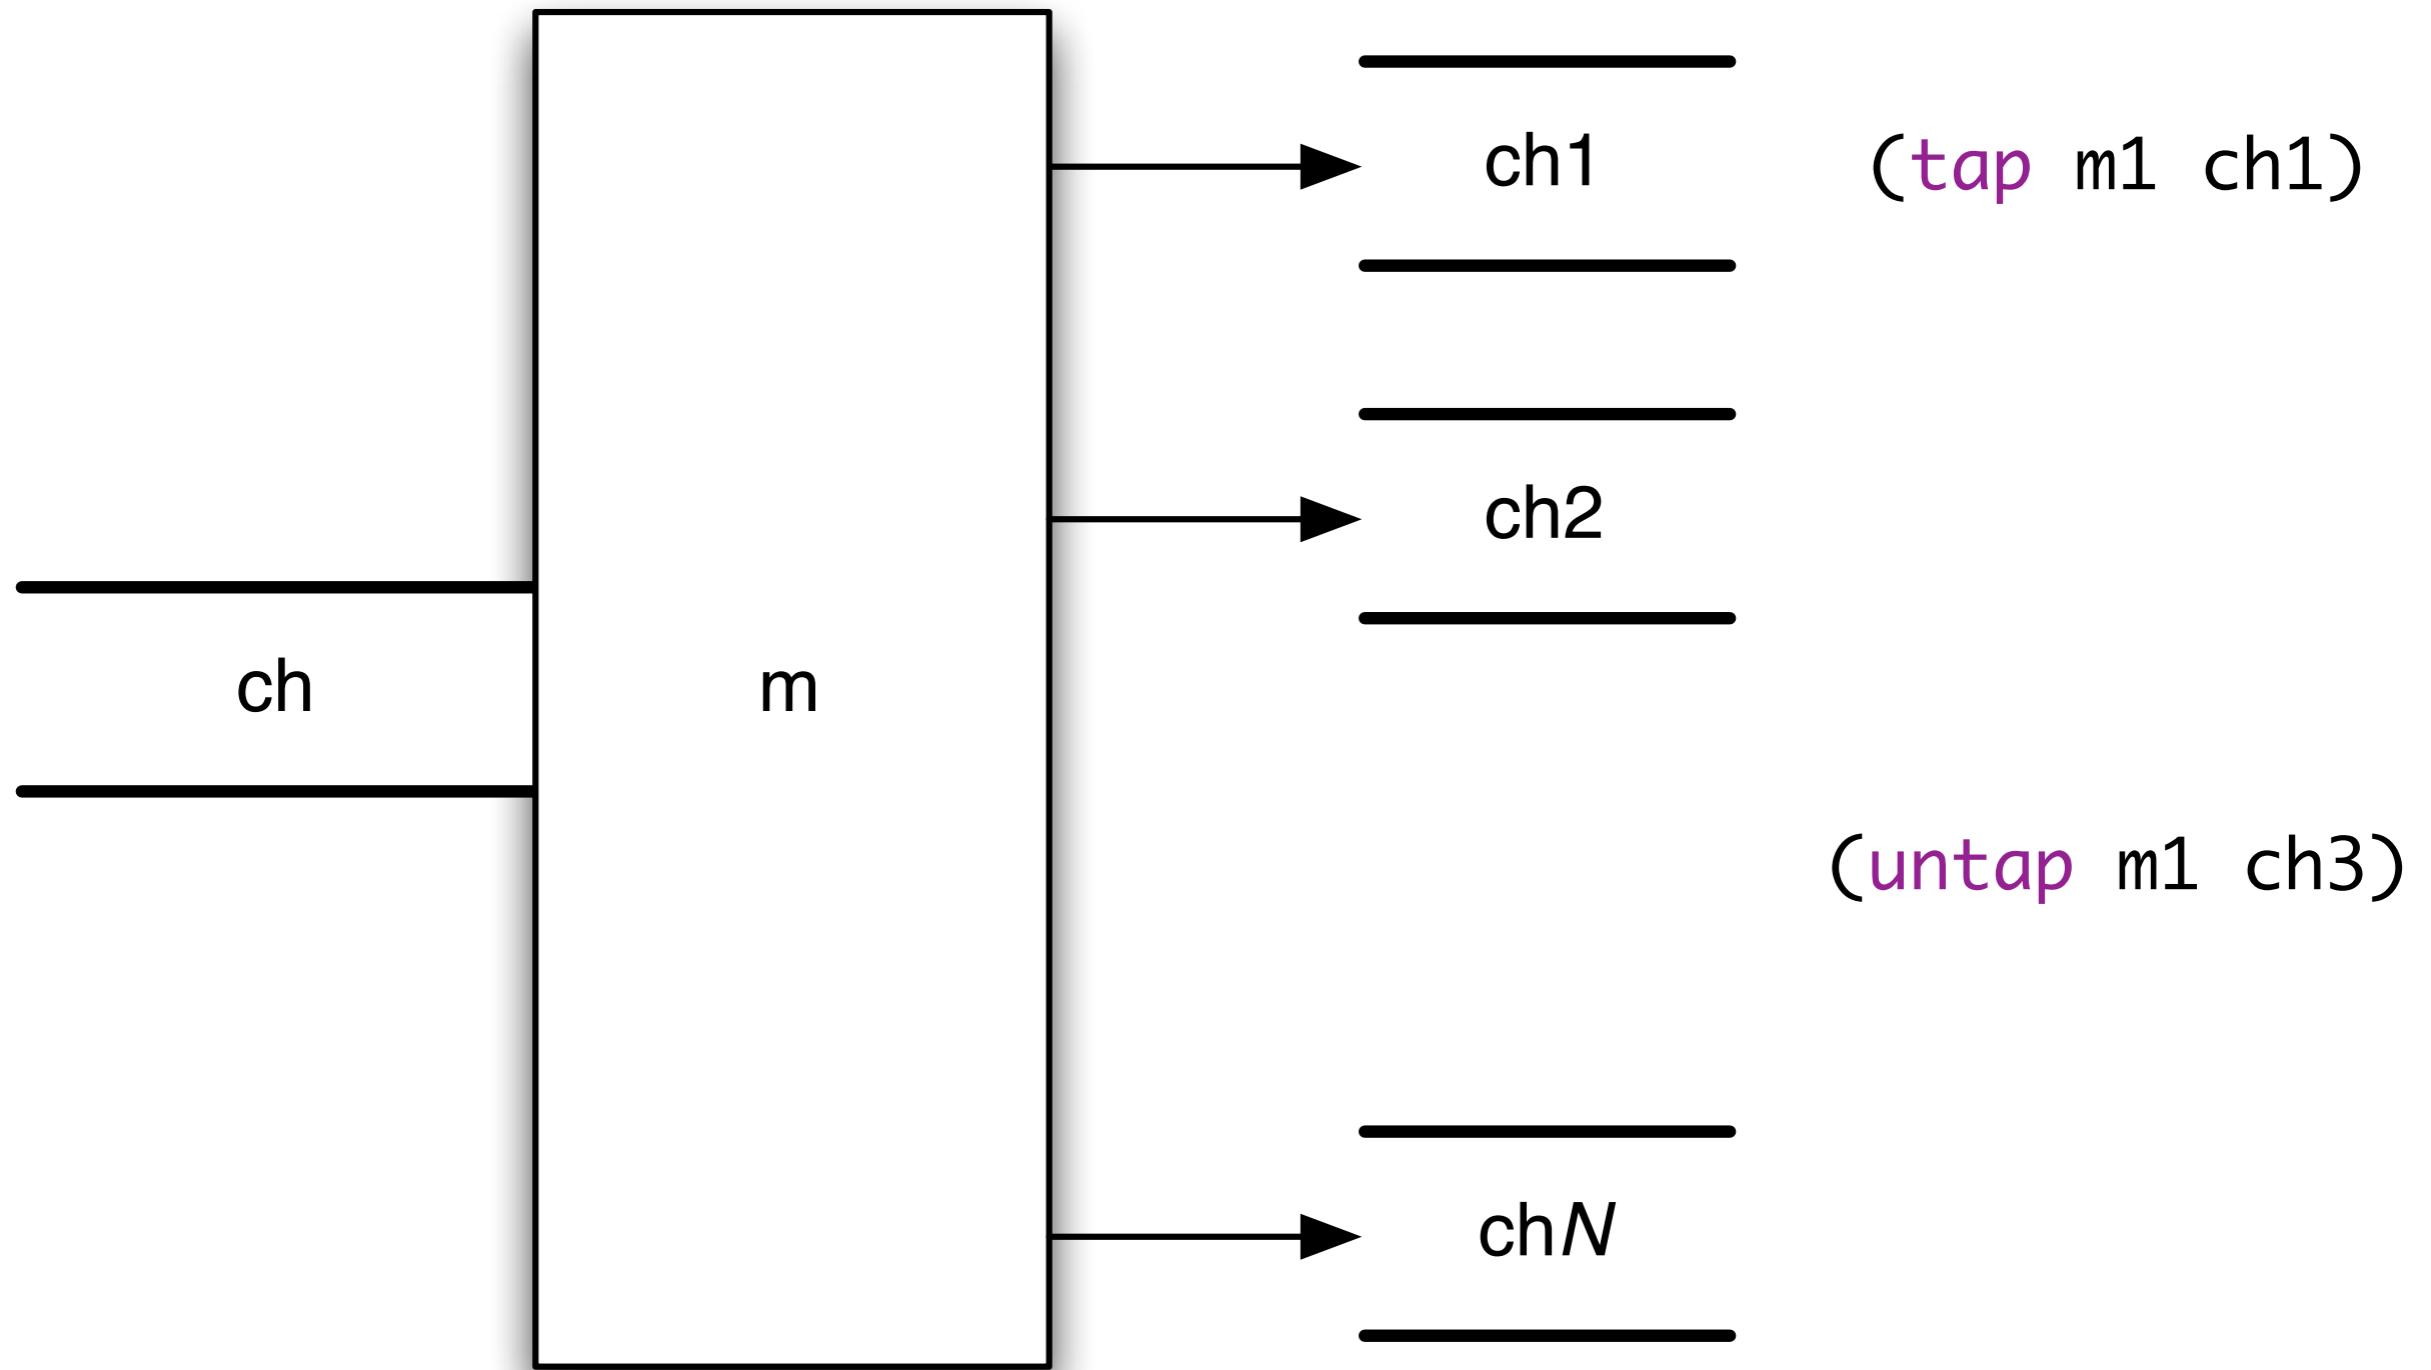

(merge ch1 ch2 out)

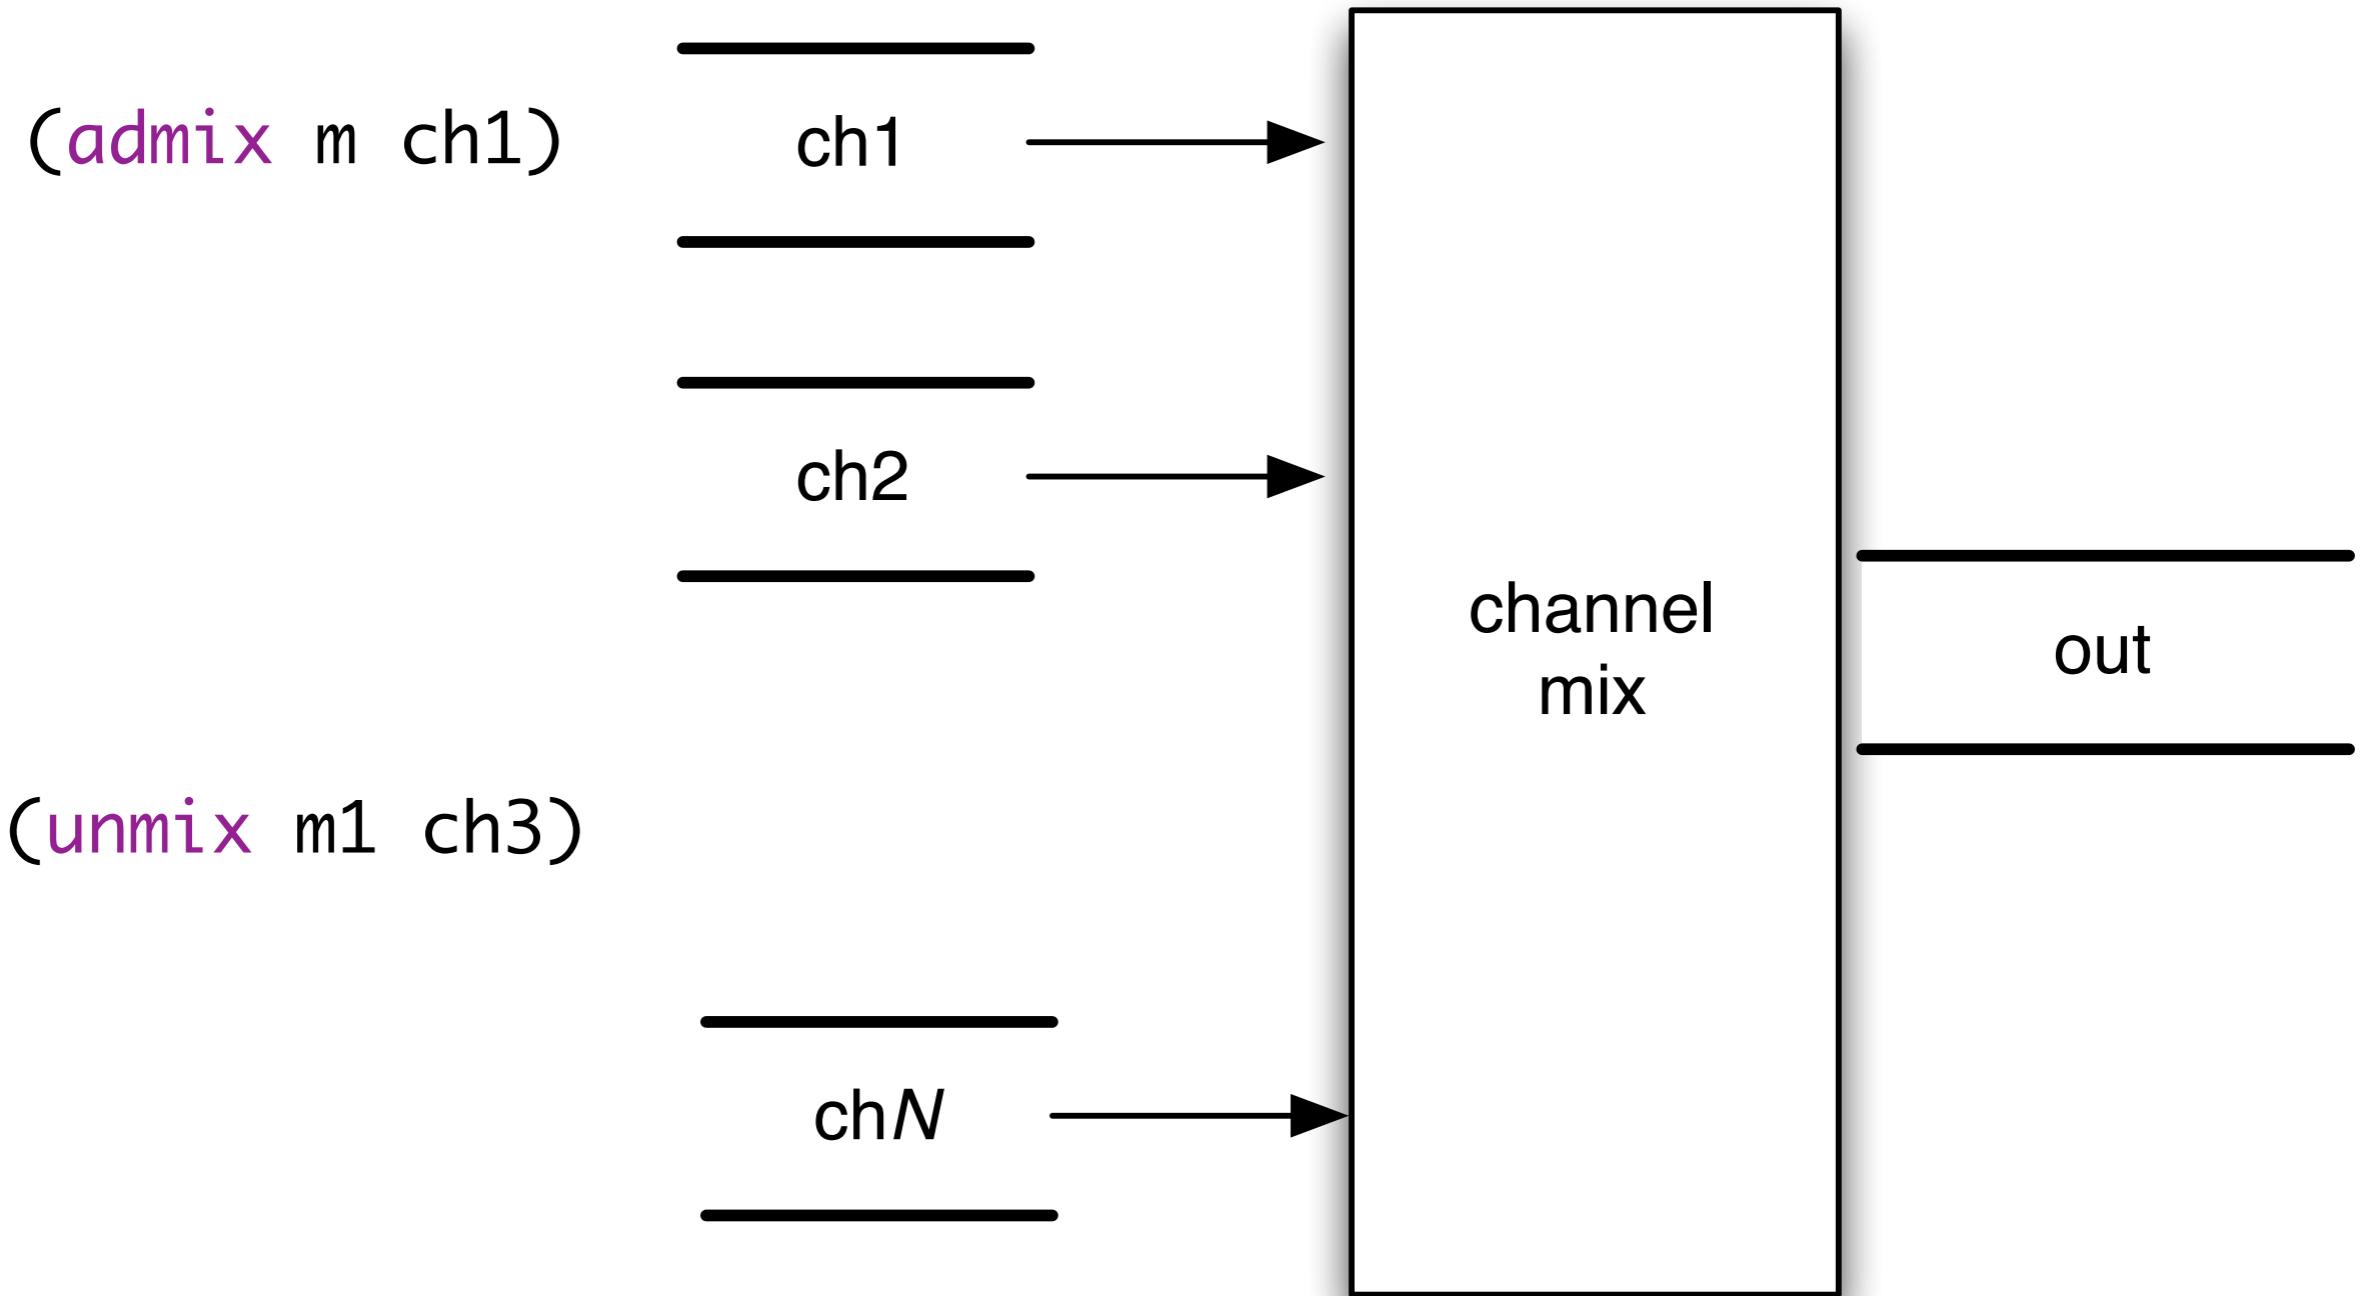

(split p ch1 truec falsec)

(mult ch)

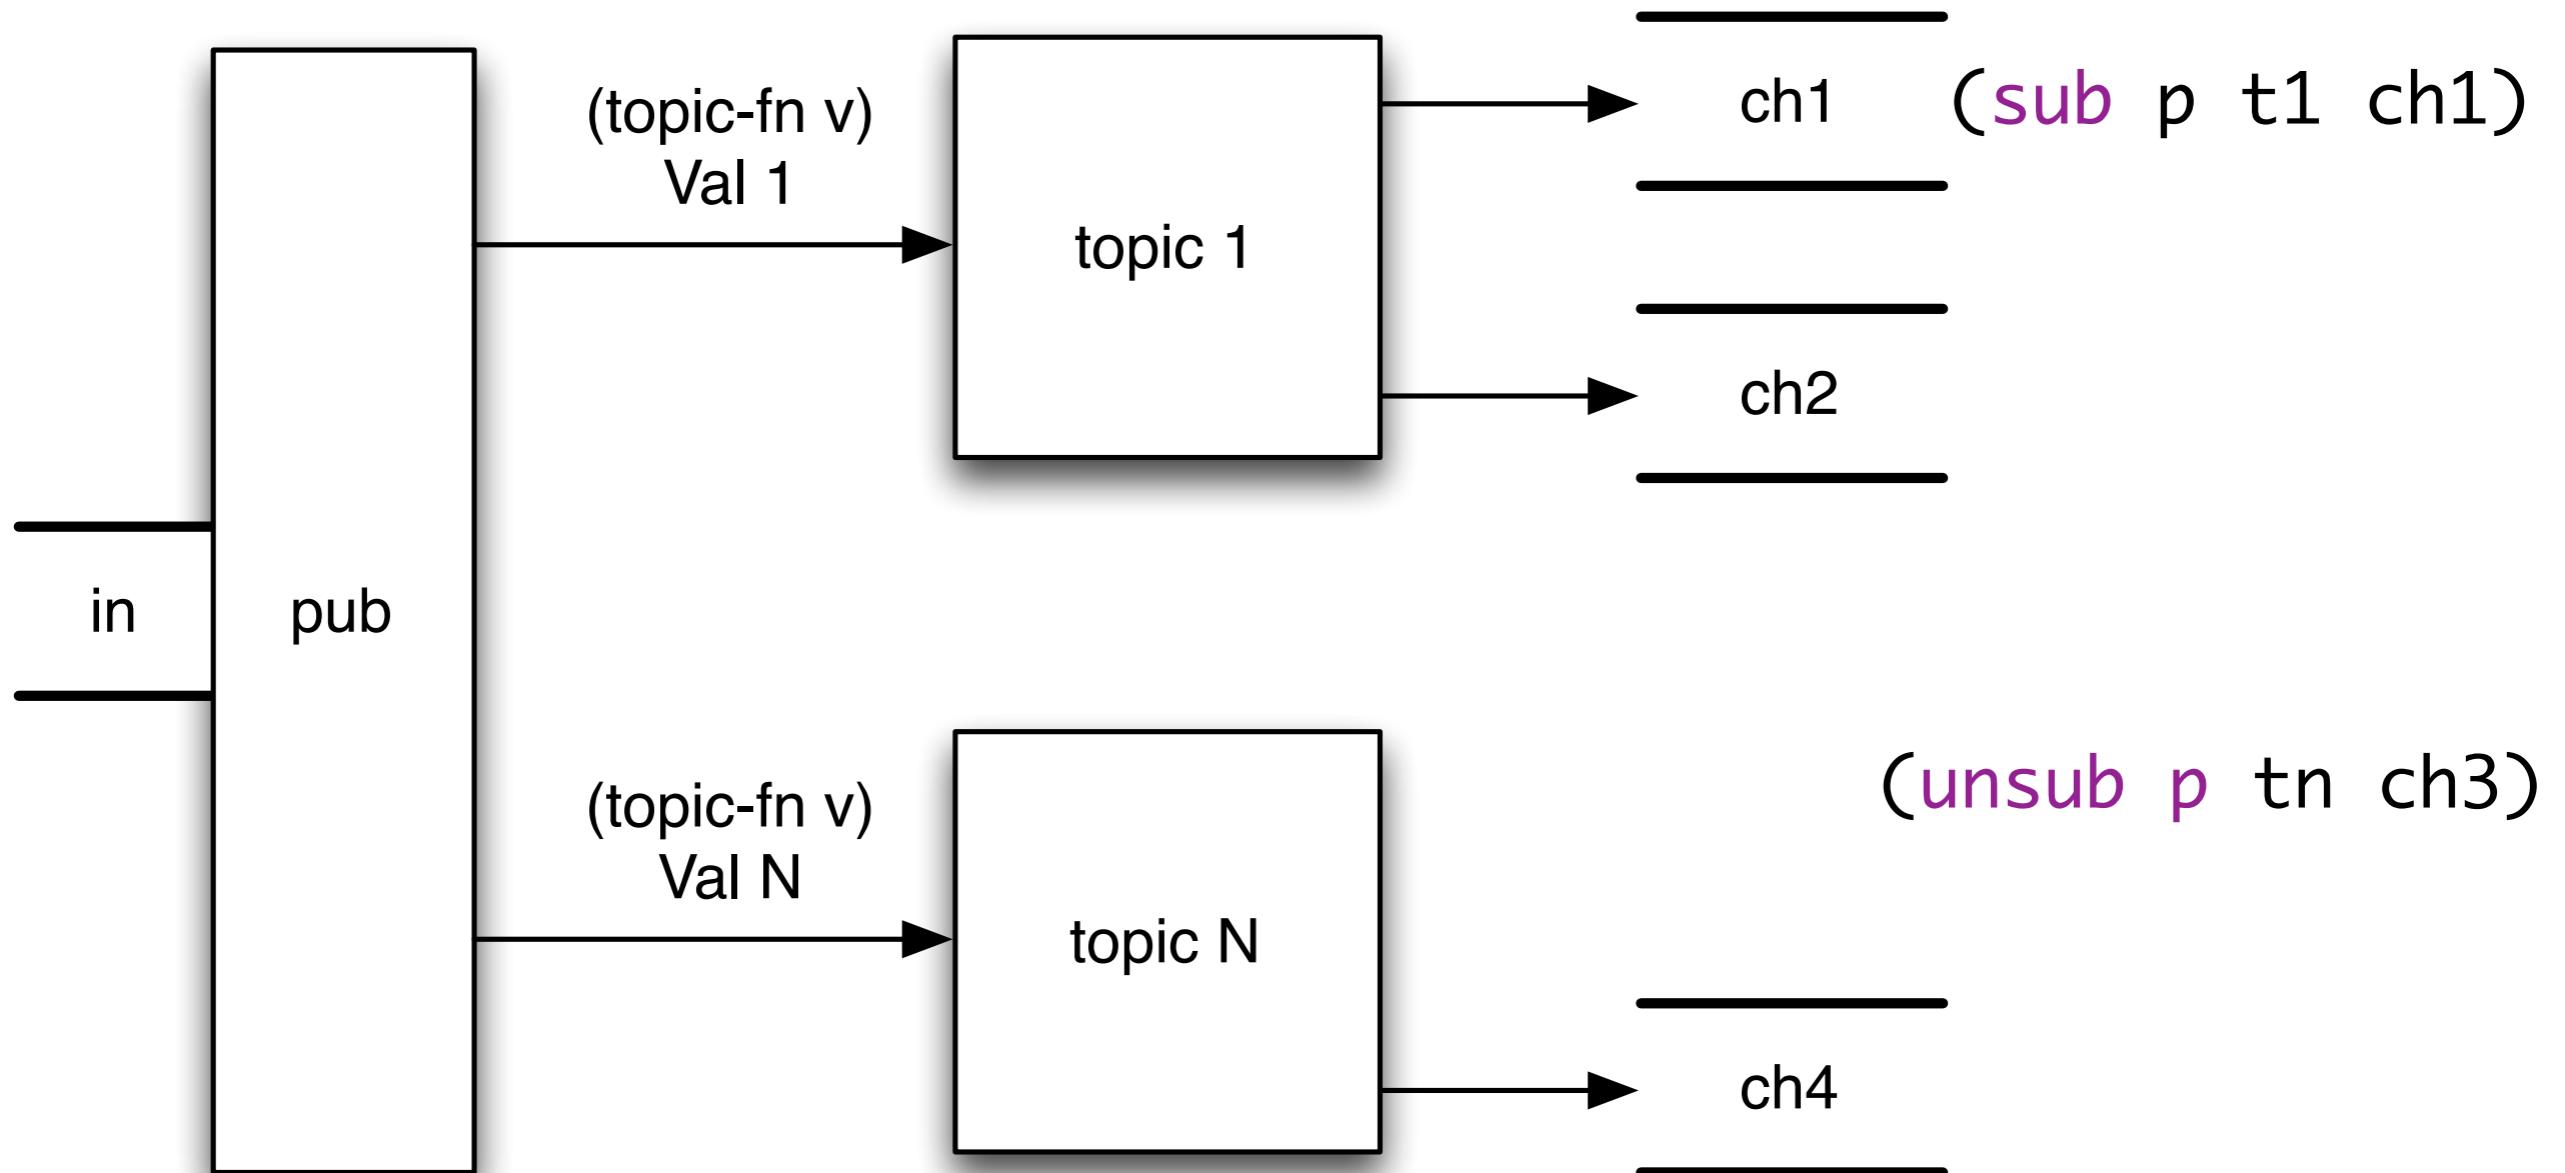

(mix ch)

(unmix m1 ch3)

(also supports soloing, muting, pausing)

(pub ch topic-fn)

multi-ops: alt*

one process, N concurrent inputs/outputs

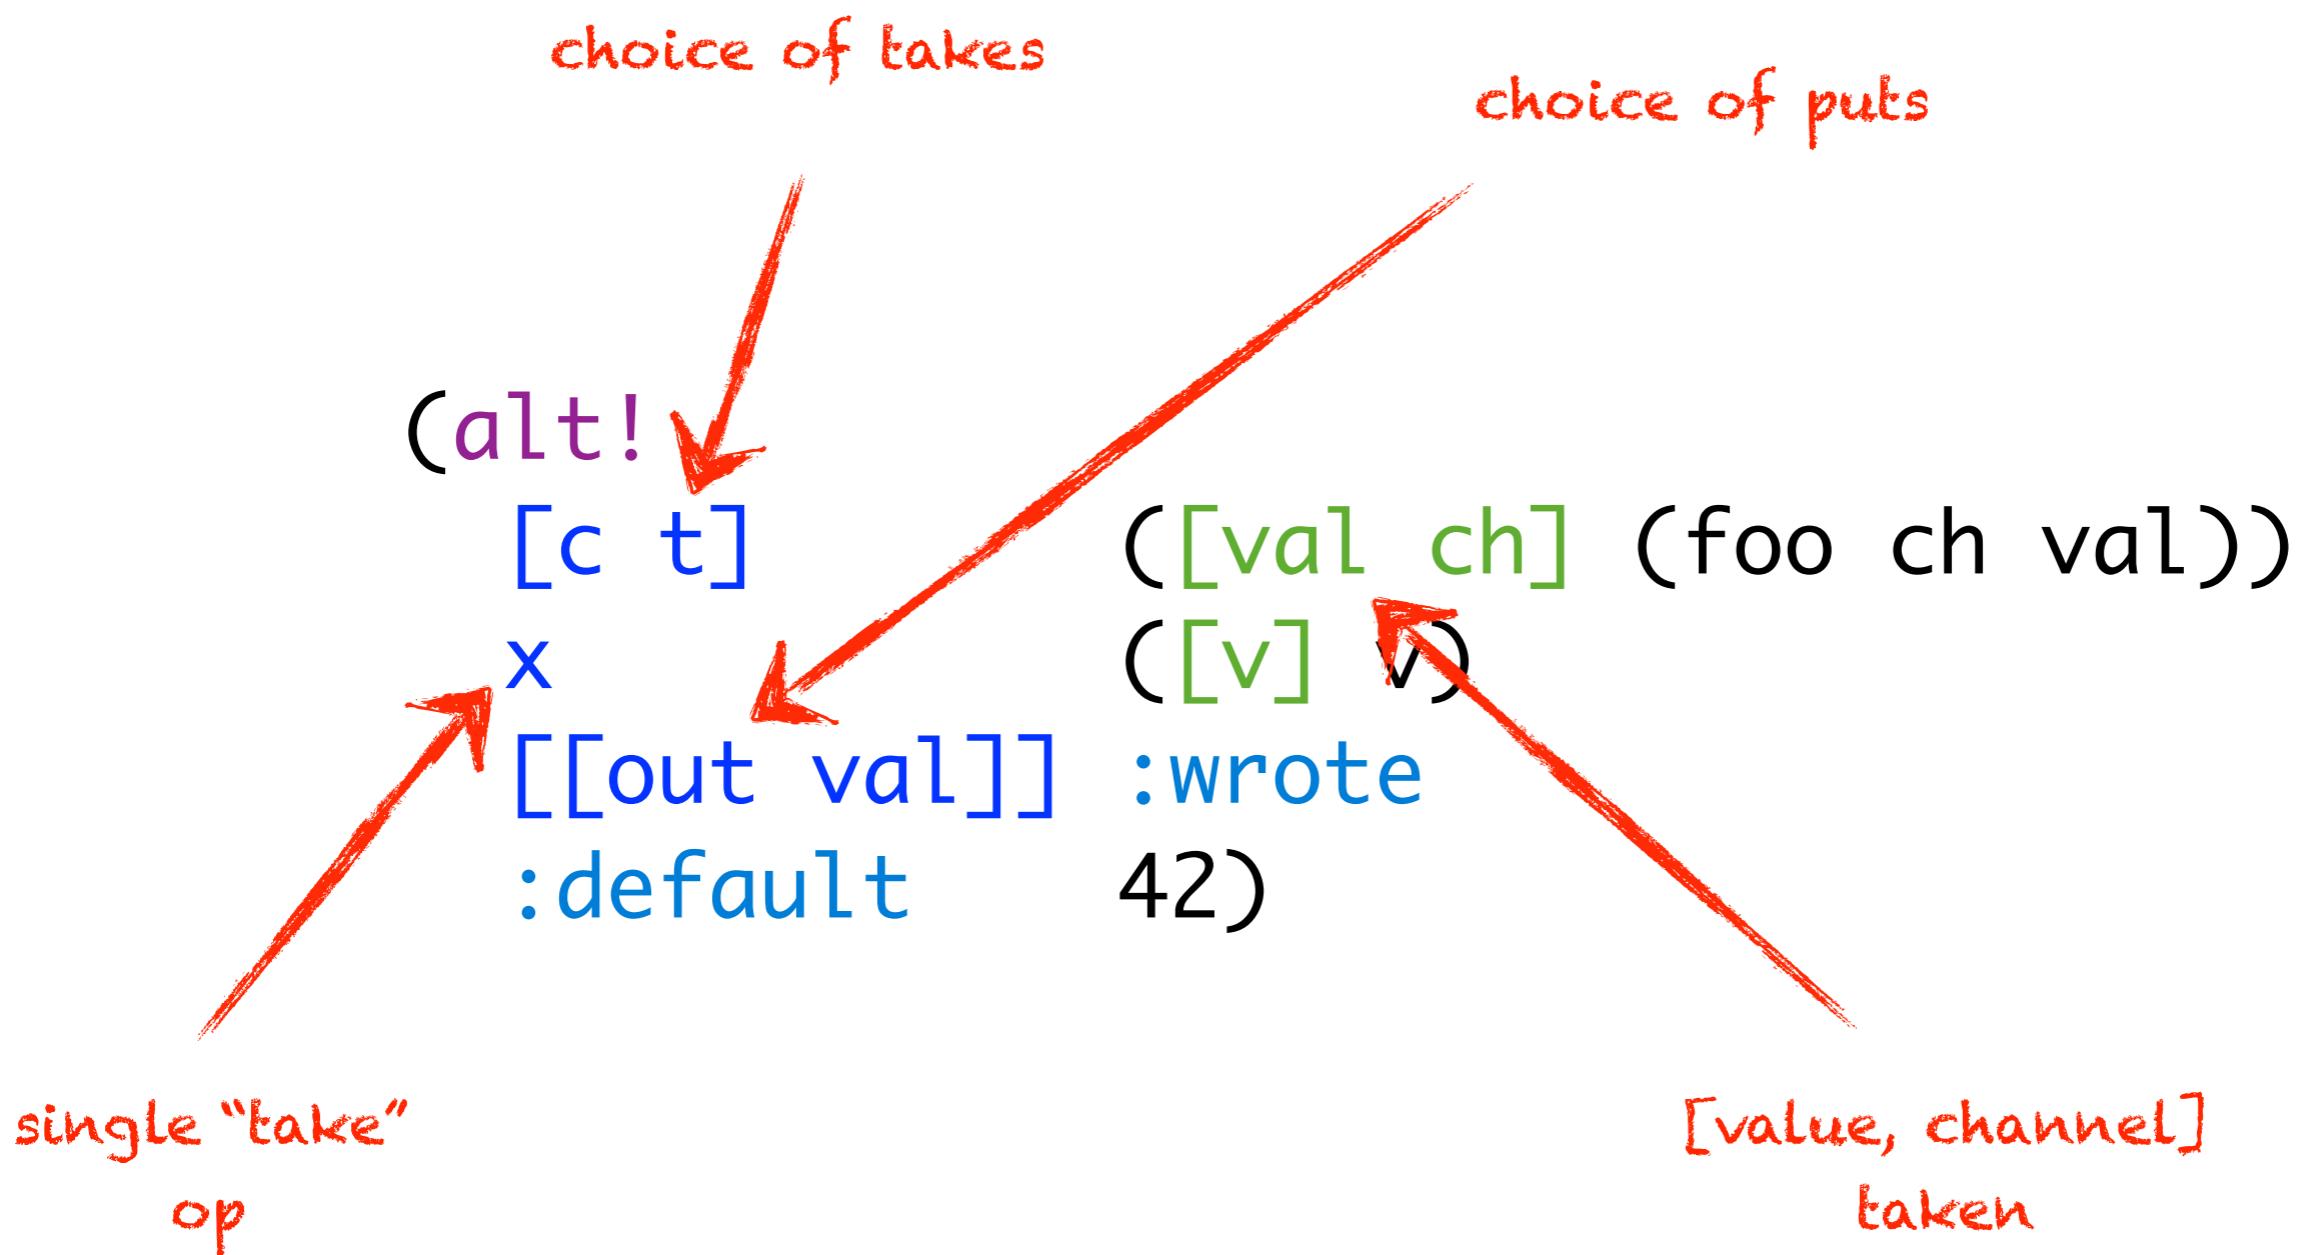

wait on multiple channel operations

puts, takes (timeouts)

compare unix select

works with threads *or* go blocks

alt!, alt!!

multi-operation examples

http://go.cognitect.com/core_async_webinar_recording

<https://github.com/cognitect/async-webinar> examples 6-10

search with SLA

```
(defn search [query]
  (let [c (chan)
        t (timeout 80)]
    (go (>! c (<! (fastest query web1 web2))))
    (go (>! c (<! (fastest query image1 image2))))
    (go (>! c (<! (fastest query video1 video2))))
    (go (loop [i 0
              ret []]
          (if (= i 3)
              ret
              (recur (inc i)
                     (conj ret (alt! [c t] ([v] v))))))))))
```

coordinates all
searches and
shared timeout

differences from go

operations are expressions (not statements)

core.async is a library, not a language feature

alts! is a *function*

alt supports priority

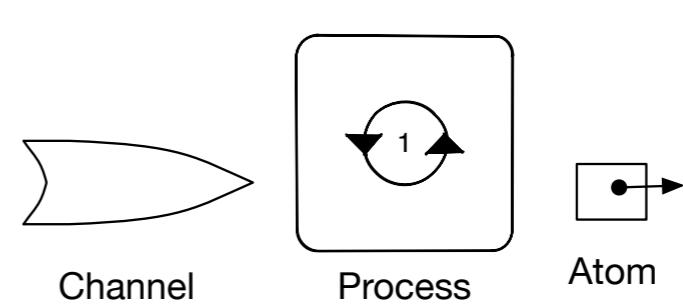

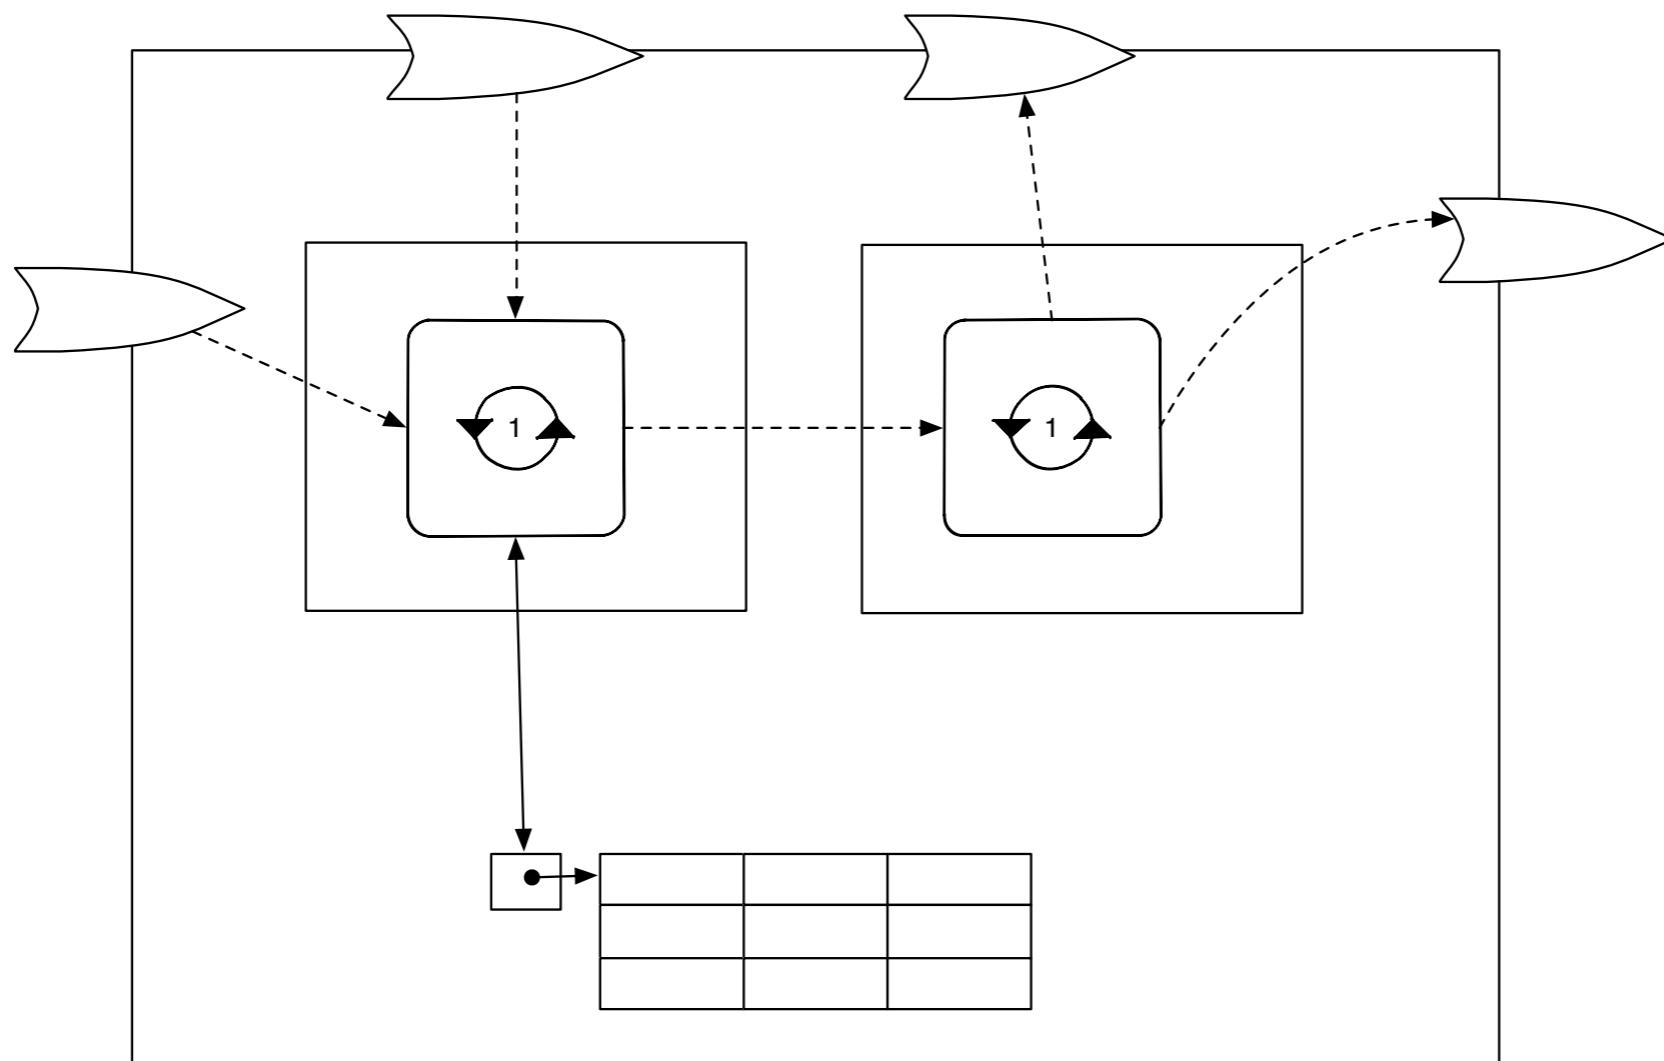

designing subsystems
with core.async

	without async	with async
arguments	active objects	maps
abstraction	protocols	maps
invocation	direct	channel put
queues	occasionally for pipelining	primary subsystem boundary
orchestration	pass objects to constructors	pass channels to constructors
errors	exceptions	don't know, don't care
state	functional or unified succession model	functional or unified succession model

control coupling with buffers

strategy	semantics	example
unbuffered	rendezvous	(chan)
fixed	block when full	(chan 10)
sliding	drop oldest when full	(chan (sliding-buffer 10))
dropping	drop newest when full	(chan (dropping-buffer 10))

visual vocabulary

what about actors?

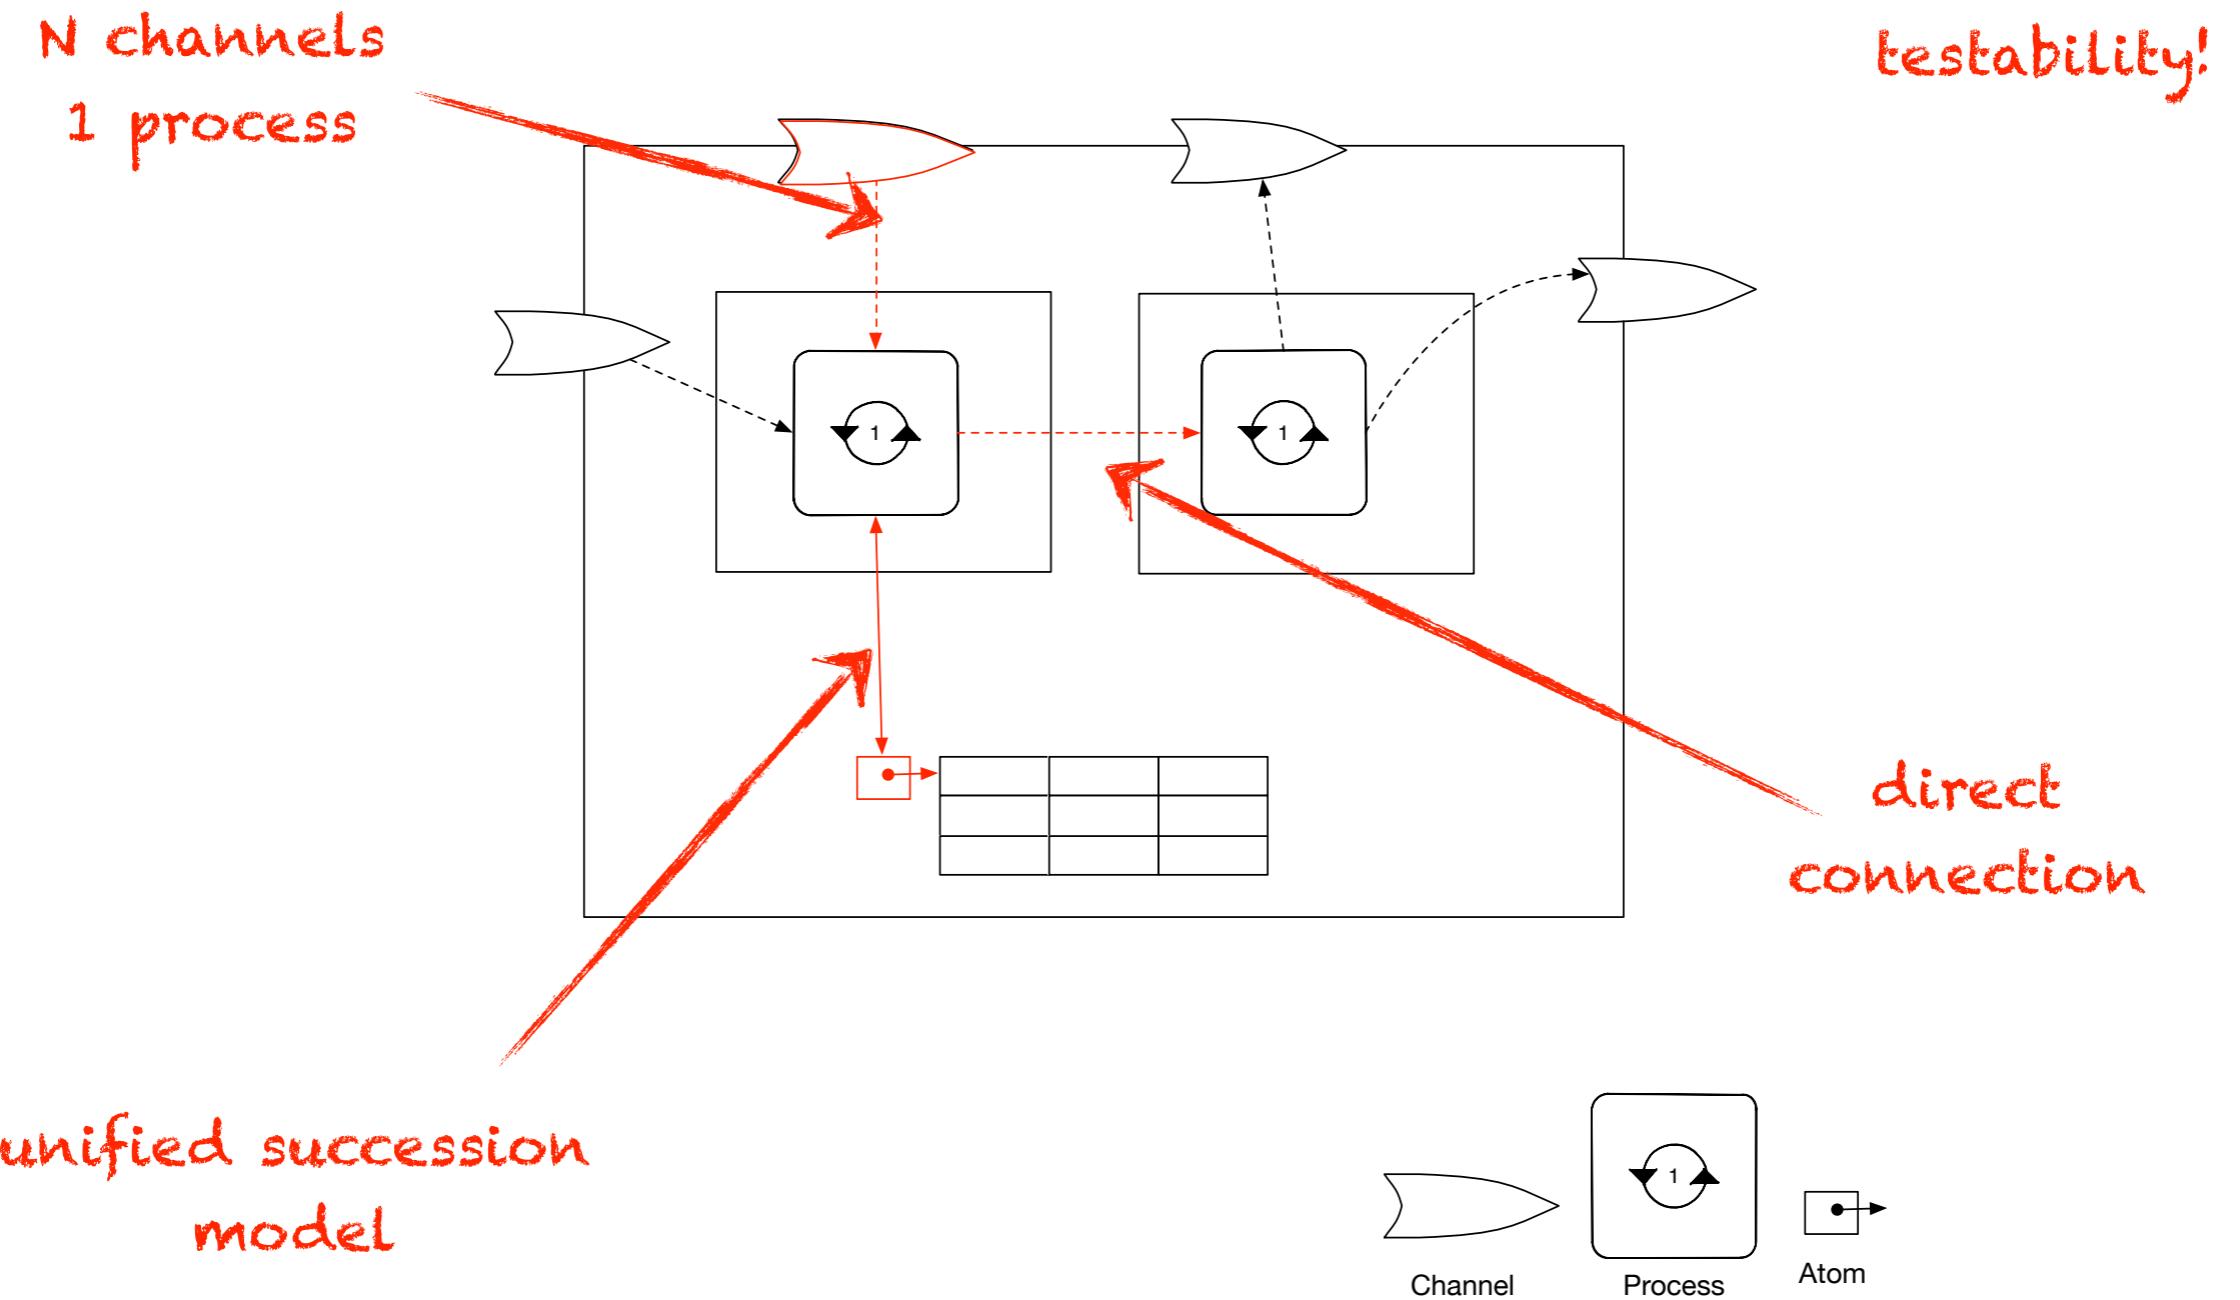

Seven Concurrency Models
in Seven Weeks
When Threads Unravel

Paul Butcher

Series editor: Bruce A. Tate
Development editor: Jacquelyn Carter

challenges for actors

hello actors

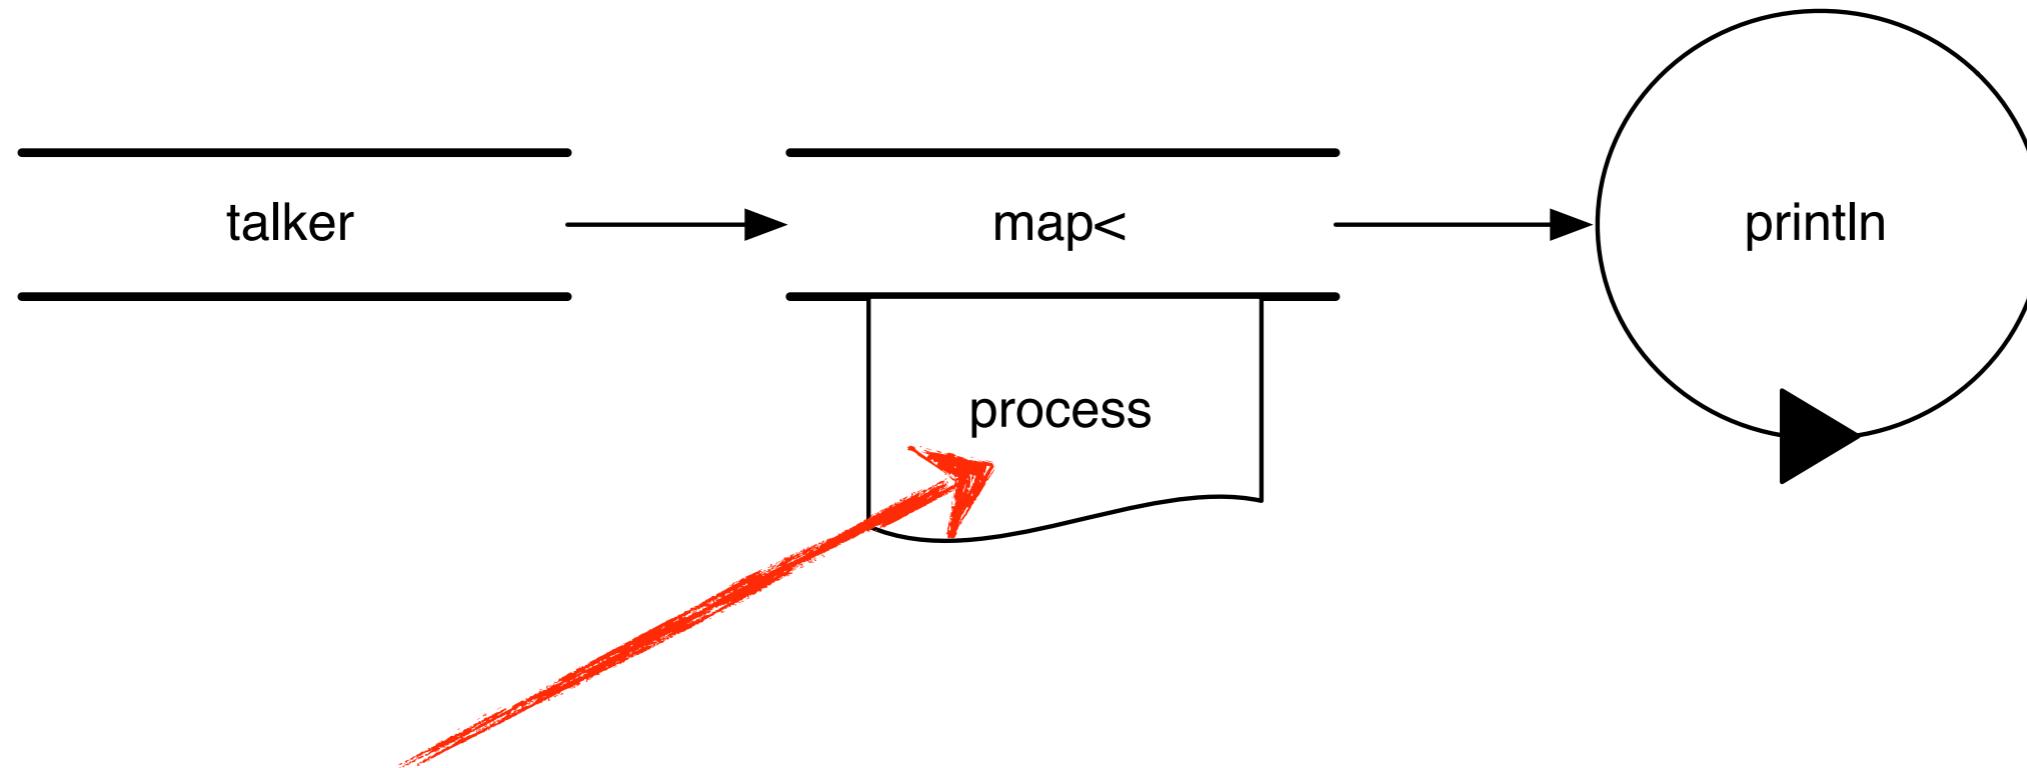

```
defmodule Talker do
  def loop do
    receive do
      {:greet, name} -> IO.puts("Hello #{name}")
      {:praise, name} -> IO.puts("#{name}, you're amazing")
      {:celebrate, name, age} -> IO.puts("Here's to another #{age} years, #{name}")
    end
  end
end
```

channel, process, & dispatch fused together

The diagram illustrates the execution flow of the actor loop. It features a large red arrow pointing from the text "channel, process, & dispatch fused together" down towards a circular node. This node contains the text "receive process println". Two horizontal lines extend from the left side of the node, each ending in a small black arrowhead pointing right, representing the flow of data or messages.

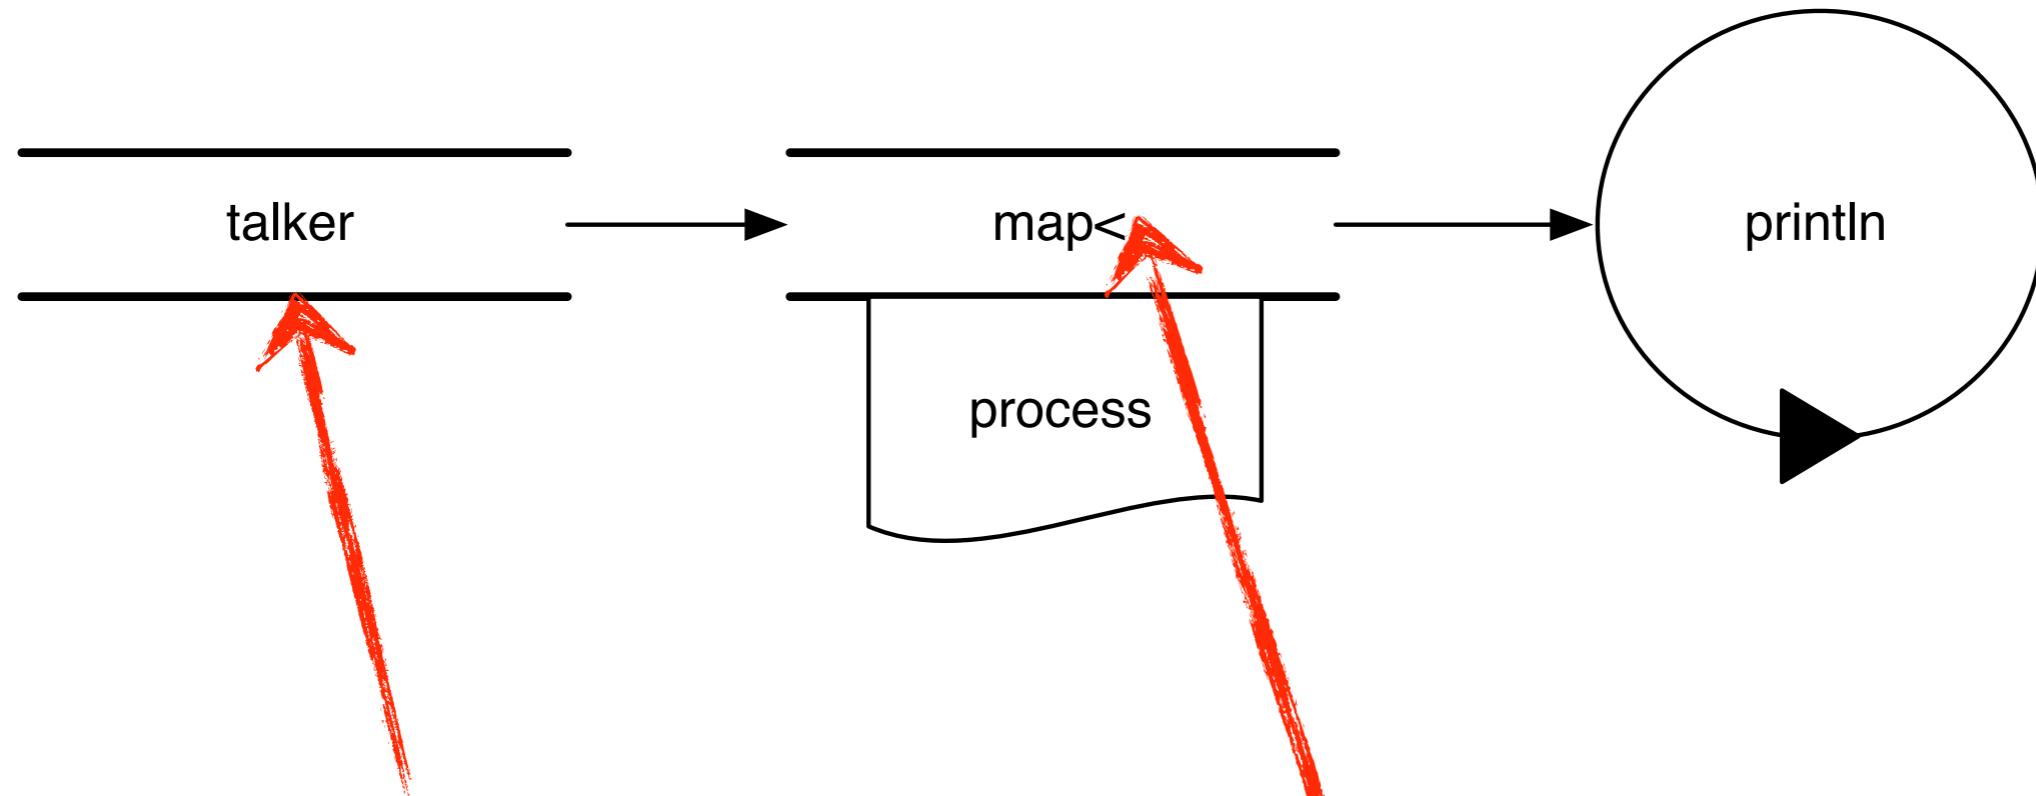

```
pid <- {:greet, "Huey"}
pid <- {:praise, "Dewey"}
pid <- {:celebrate, "Louie", 16}
```

closed (pattern) dispatch

```
(defn process-1
  [item]
  (match
    [item]
    [[[>:greet & [name]]] (str "Hello " name)
    [[[>:praise & [name]]] (str name ", you're amazing")
    [[[>:celebrate & [name age]]] (str "Here's to another " age " years, " name)) )
```

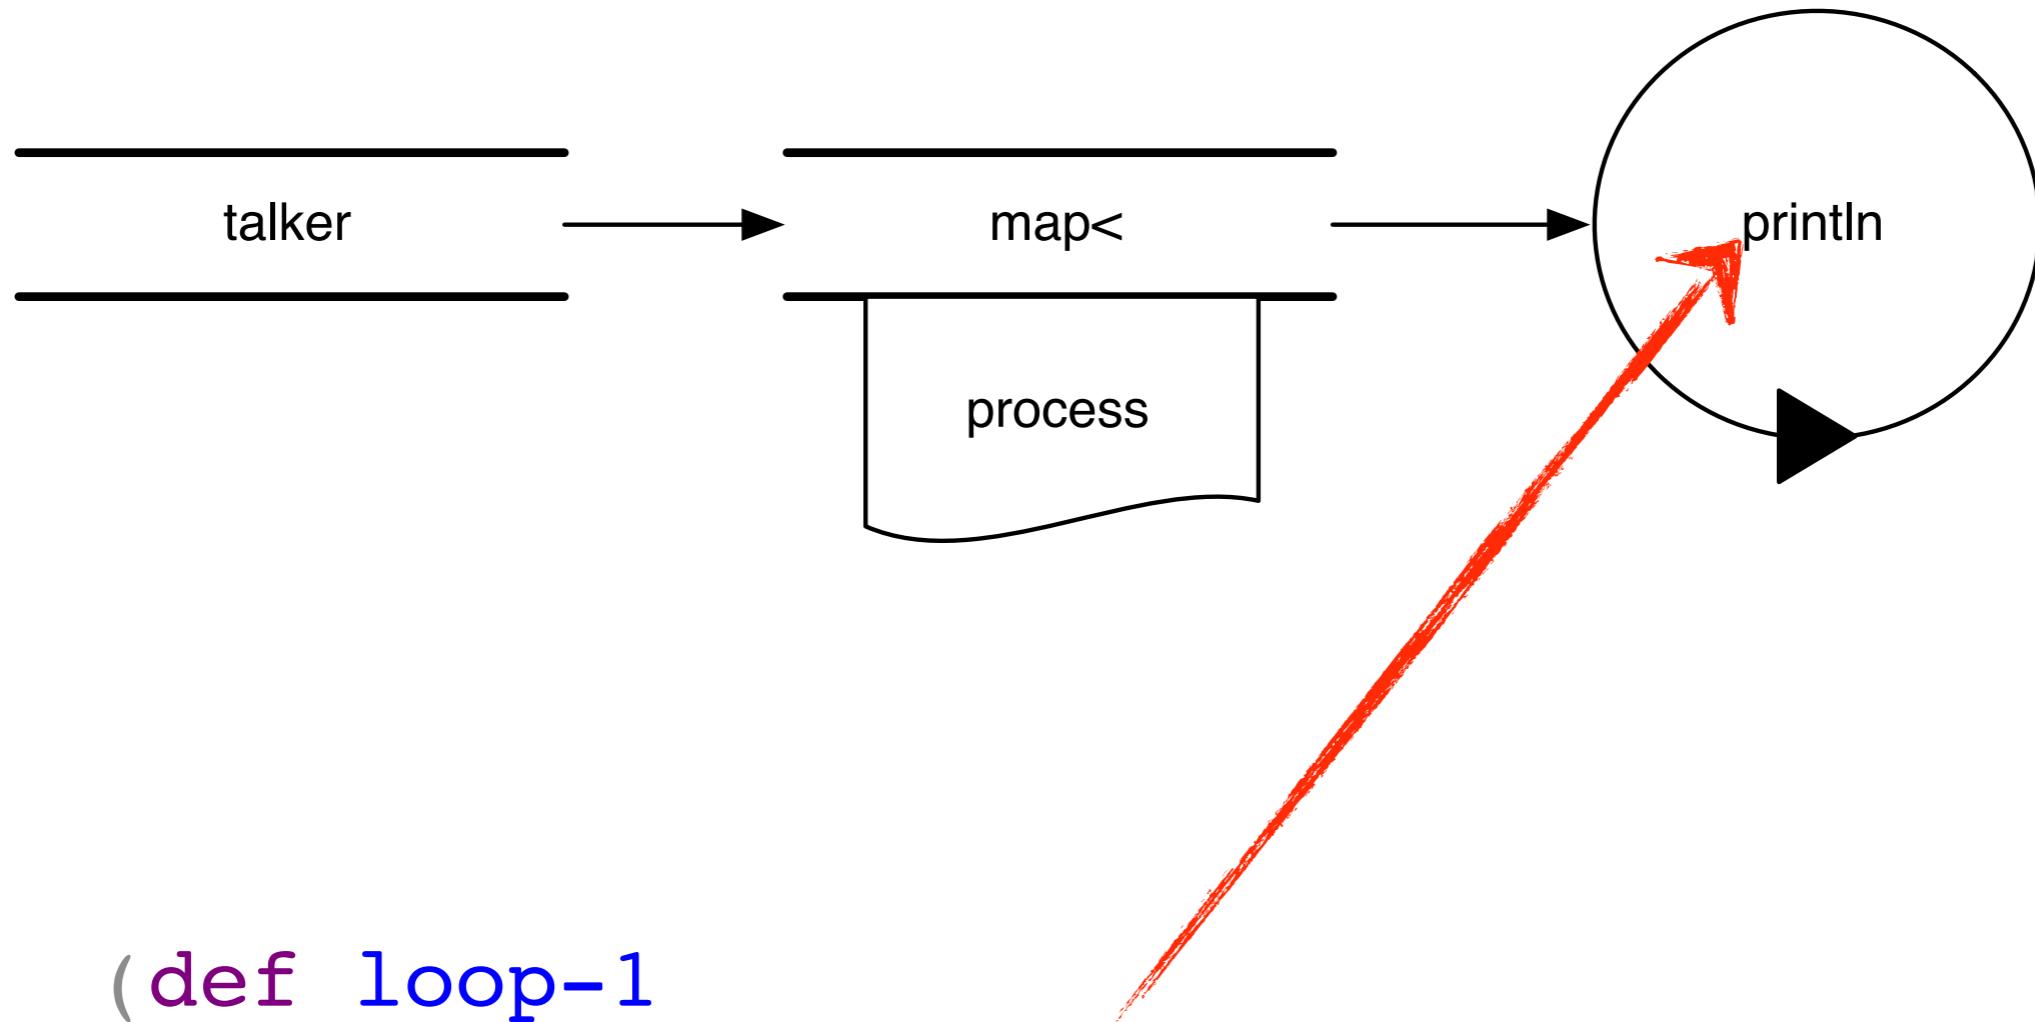

+channels

```
(def talker-ch-1 (chan))
```

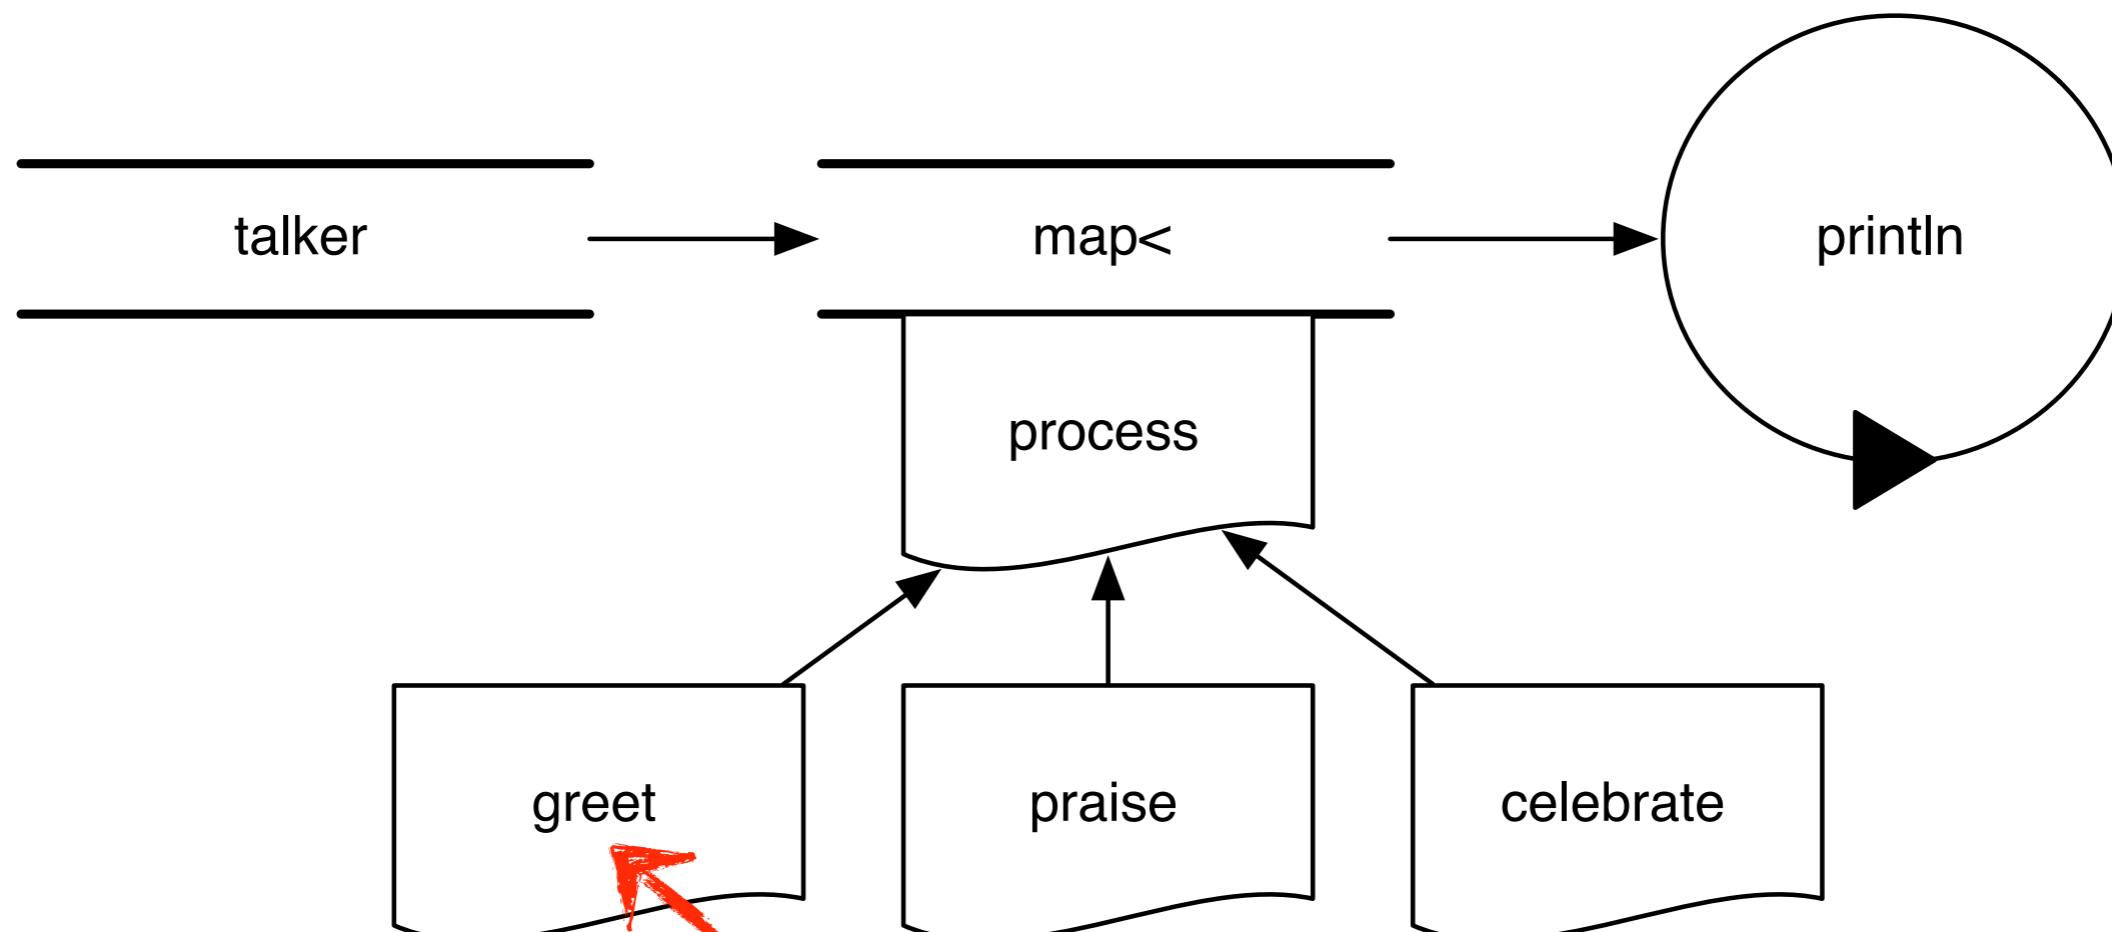

```
(def composed-ch-1
  (->> talker-ch-1 (map< process-1))))
```

+processes

```
(def loop-1
  (go-loop [msg (<! composed-ch-1)]
    (when msg
      (println msg)
      (recur (<! composed-ch-1))))))
```

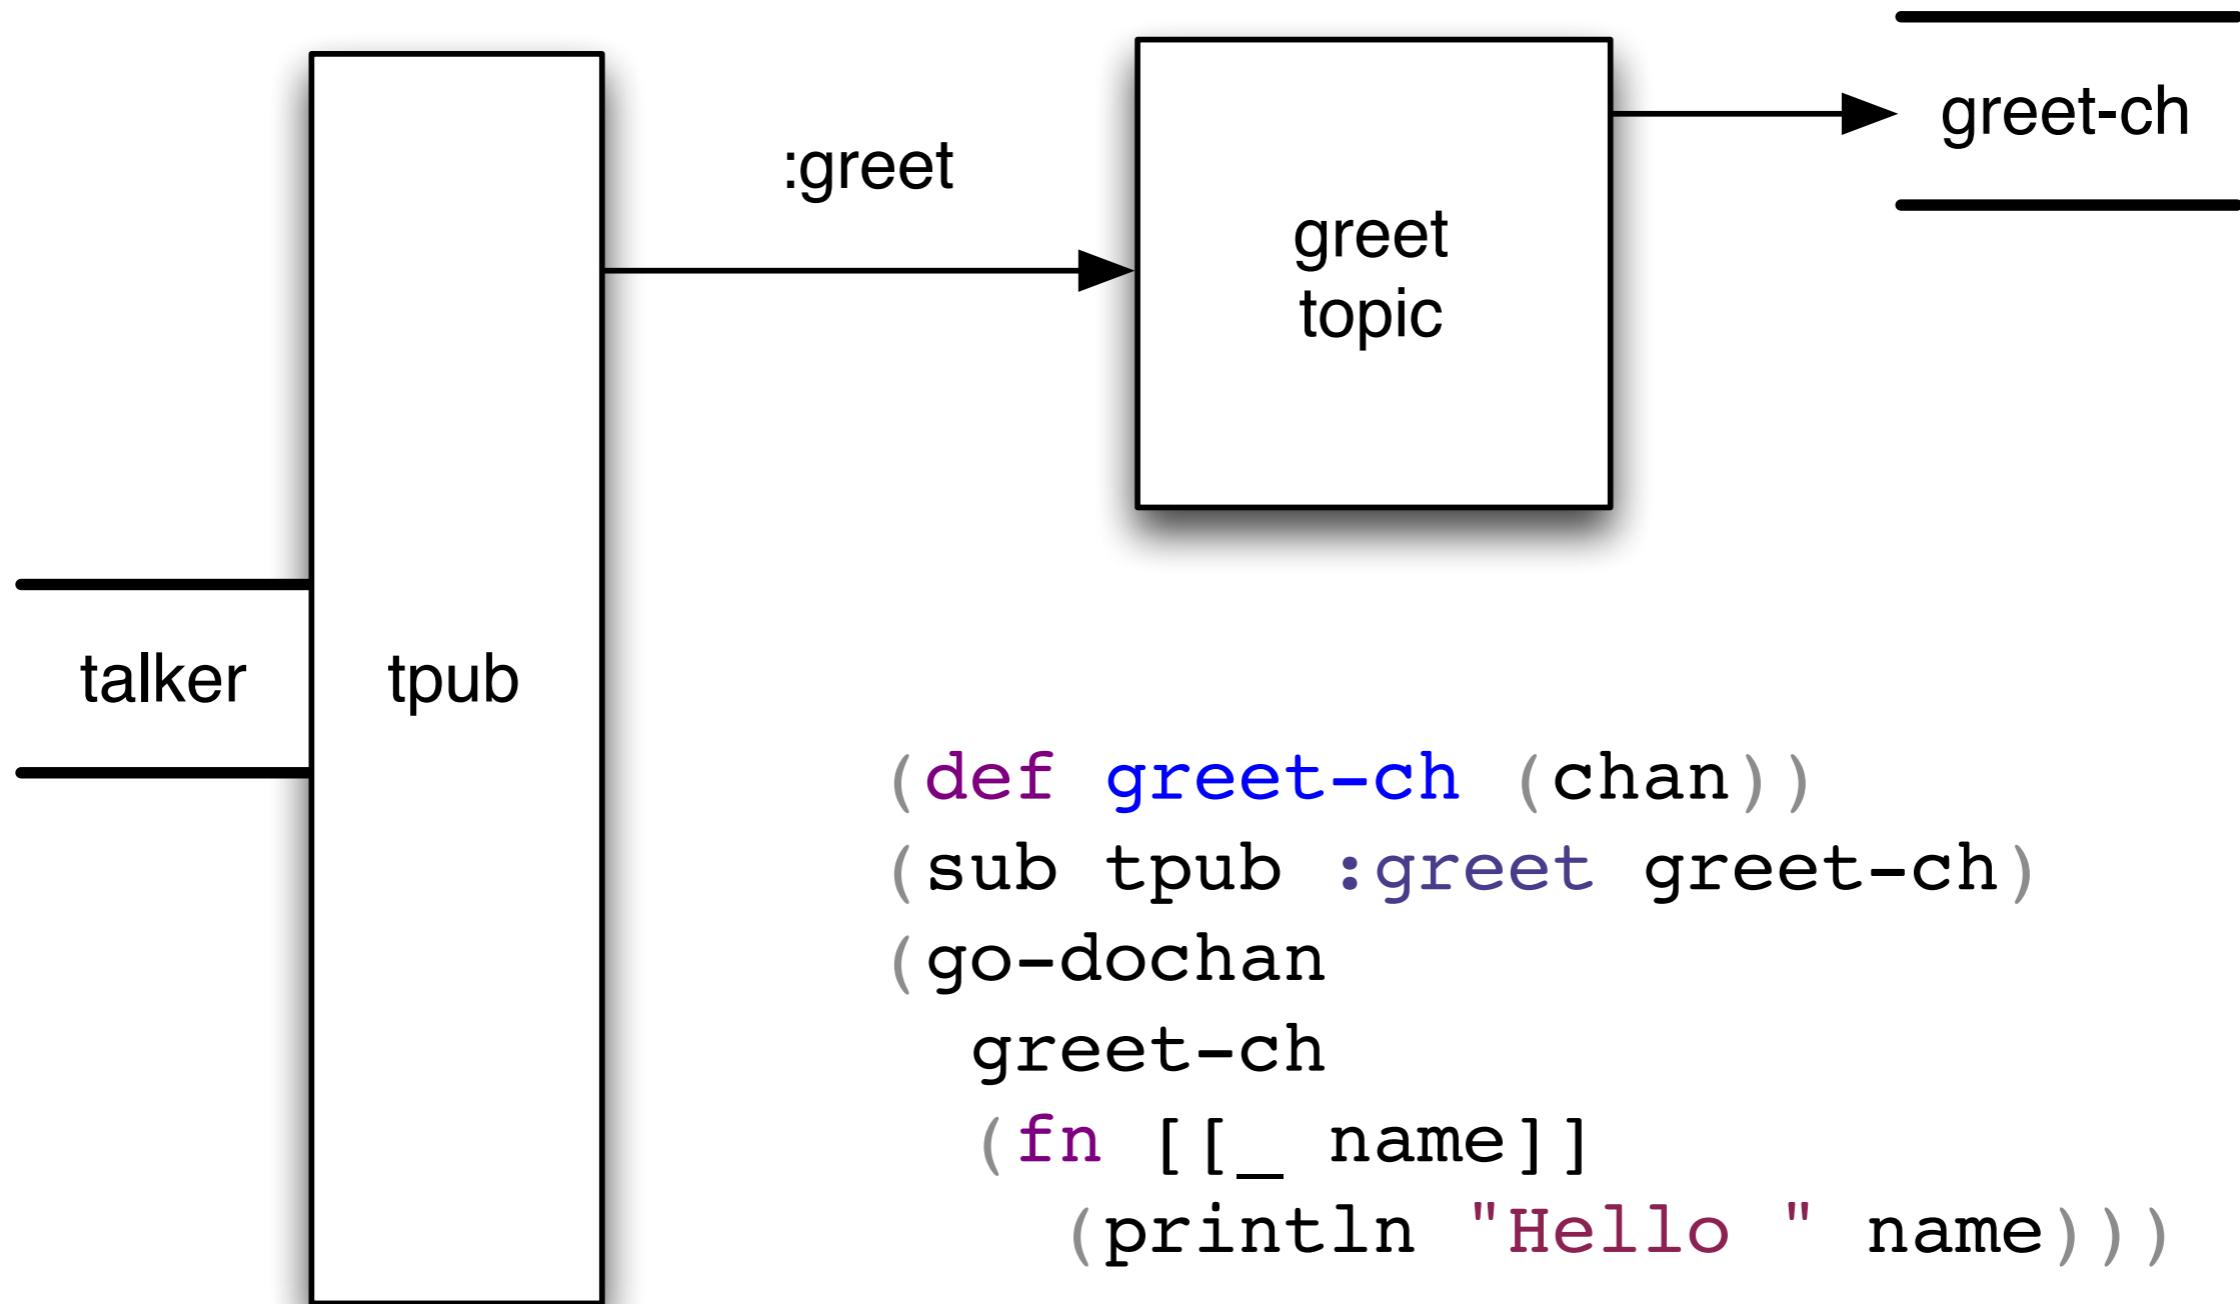

substitute open dispatch

```
(defmulti process-2 (fn [[k & more]] k))
```

```
(defmethod process-2 :greet
  [[_ & [name]]]
  (str "Hello " name))
```

substitute pub/sub
