Philadelphia, Pennsylvania April 8-9, 2010

# Airplanes to Application Development

*JonKern@comcast.net / Architect & Agile Coach*

# Overview

---

- ❑ A look at B777 aircraft development project
- ❑ Parallels to software development
- ❑ What we can learn from product engineering?

# Requirements & Stakeholders

- ❑ Jan 90 - Early involvement with 8 major airlines
- ❑ Mar 90 - Initial requirements
  - ◆ X-section  $\approx$  B747
  - ◆ 325 passengers
  - ◆ Fly-by-wire controls
  - ◆ “Glass” cockpit
  - ◆ Flexible interior
  - ◆ 10% better seat-mile cost
- ❑ Oct 90 - United Airlines becomes launch “Beta” Customer
- ❑ UA extends the scenarios
  - ◆ Requirements change

# Lessons:

---

- ❑ Create a coalition of stakeholders
- ❑ Gather input from key users
- ❑ Understand the business drivers
- ❑ Adapt to changing requirements

# Development Team

---

- ❑ Team Makeup
  - ◆ 240 Design teams
  - ◆ Up to 40 members each
- ❑ Assigned individual components
  - ◆ Pieces of the integrated whole
  - ◆ Clear picture of where it fits in
  - ◆ Clear feedback loops
  - ◆ Prominent time-based integration checkpoints
- ❑ Jan 93—Formally dubbed “B777”
- ❑ UA engineers join other airline “customer” teams

# Lessons:

---

- ❑ Divide and conquer
- ❑ Maintain big picture, but allow creativity
- ❑ Include customers on development team
- ❑ Develop clear communication
- ❑ Let the computer models assist in that communication
- ❑ Have integration strategy to ensure no team strays (too far)

# Trade-offs to Find “Sweet Spot”

---

- ❑ Weight *versus* Cost
- ❑ Teams allocated goals at outset
- ❑ Difficult and imprecise
- ❑ All systems interdependent
- ❑ How best to allow change?
  - ◆ Centralized authority?
  - ◆ Decentralization is best!
- ❑ Decision support rule
  - ◆ 1lb savings worth \$300
- ❑ 5000 engineers able to make decisions

# Lessons:

---

- ❑ Team empowered to be creative and responsive
  - ❑ Decision still controlled within business parameters
  - ❑ No decision-making delays due to hierarchical sign-off ceremonies for every little request
  - ❑ Continuous build system enables gathering measurements by which goals are evaluated
- 
- ❑ Regarding “cost metrics” for development, this is challenging for most software projects

# Test the Process

---

- ❑ Risk mitigation is a key to development. For example:
- ❑ Test the modeling process
  - ◆ Risk: CAD methodology – will it work?
  - ◆ Built physical mock-up
  - ◆ Used all design techniques
  - ◆ Evaluated the end-product
- ❑ Result was an astounding success!
- ❑ Canceled all other component tests of the *process*

# Lessons:

---

- ❑ Test the process
- ❑ Prove you can deliver working results
- ❑ Gain faith in the automated “transforms” from the design “meta data” and the end results of a “build”
- ❑ Work in small batches
- ❑ Enable & consume rapid feedback
- ❑ Change the plan as needed based on findings

# 100% Computer-Aided Design

---

- ❑ First commercial aircraft example
- ❑ 3D CAD drawings for all design components
- ❑ Virtual 777 could be
  - ◆ Assembled
  - ◆ Simulated
  - ◆ Interference checked
- ❑ Reduced costly rework
- ❑ Provided early feedback

# Lessons:

---

- ❑ Economics of past development efforts made it clear that modeling/testing was valuable
  - ◆ “Gambled” and built CAD tool as they went along
  - ◆ Up-front effort was expected to yield ultimate savings in time and money, and improved customer satisfaction
- ❑ Build “generators” from models to...
- ❑ The Virtual 777 – CI
  - ◆ Continuous builds
  - ◆ Integration tests
- ❑ Learn from the tests
  
- ❑ Do you have any costly processes that could be mitigated?

# Production/QA Schedule

---

- ❑ Jan 93 - production begins  
(3yrs after requirements!)
- ❑ Apr 94 - prototype rolled out
- ❑ Jun 94 - first flight
- ❑ Apr 95 - airworthiness  
certifications received
- ❑ May 95 - first delivery
- ❑ Jun 95 - first commercial flight

# The Parallels to Software Dev

---

- ❑ We can learn from the “Triple 7”
  - ◆ Committed clients!
  - ◆ Architecture is key
    - ▶ 240 Component teams
  - ◆ Empower teams
    - ▶ Use “cost” decision rules
  - ◆ Frequent results & feedback through continuous integration
    - ▶ Reduced queue wait times
  - ◆ Enable change at low levels
    - ▶ Reduced cost of delay
  - ◆ Wise use of process & tools
    - ▶ Thin slice through the entire process proven out
  - ◆ Trust but verify

# What About Your “Factory?”

---

- ❑ Do you...
  - ◆ Involve the client?
  - ◆ Have clear business purpose and goals?
  - ◆ Have clear and effective architecture?
  - ◆ Encourage a high-powered team?
  - ◆ Have continuous integration tests?
  - ◆ Test the process?
  - ◆ Deliver frequently?
  - ◆ Embrace change?
- ❑ Can you tie development action to “cost/benefits”?
- ❑ If your software were visible/physical, would it be pretty?
- ❑ FWIW: If you are like me, plenty of room to always improve!

# Summary

---

- ❑ The engineering discipline has a lot to teach our software community
- ❑ Finding the “sweet spot” requires understanding the dynamics of your specific product’s economics
- ❑ Look around at other professions for patterns and processes that might help you succeed
- ❑ Everyone has the responsibility to be a disciplined professional – including the client
- ❑ To move our profession closer to engineering, we must emerge from the dark recesses of the “cubicle”
- ❑ FWIW: These are the sort of techniques I have used successfully

# Questions?

---

- ❑ Feel free to ask any questions
- ❑ Email: [jonkern@comcast.net](mailto:jonkern@comcast.net)
- ❑ Website/Blog: <http://technicaldebt.wetpaint.com>
